

Actuarial Status of the OASI and DI Trust Funds*

This article presents the summary from the 1989 Annual Report of the Board of Trustees of the Old-Age and Survivors Insurance (OASI) and Disability Insurance (DI) Trust Funds. The financial condition and actuarial status of the OASDI program are examined based on four alternative assumptions. The long-range 75-year estimates indicate that, under the intermediate alternative II-A assumptions, the positive balances in the first part of the 75-year projection period nearly offset the later deficits, so that the program, as a whole, has an actuarial deficit of 0.10 percent of taxable payroll. Based on the intermediate alternative II-B assumptions, the OASDI program has larger future deficits that yield an actuarial deficit of 0.70 percent of taxable payroll. However, the expected accumulation of the trust funds during the next 20-30 years provides ample time to monitor the financial status of the program and to take the appropriate action in the future if it still appears to be warranted. During the first part of the long-range projection period, under the alternative II-B assumptions, the combined OASI and DI Trust Funds are expected to accumulate rapidly to a peak fund ratio of 547 percent of annual outgo in the year 2014. Thereafter, the fund ratio is estimated to decline until the funds are exhausted in 2046. For OASI and DI, separately, the long-range actuarial balances, based on alternative II-A assumptions, are +0.03 percent and -0.13 percent of taxable payroll, respectively. Based on alternative II-B assumptions, both programs have actuarial deficits, which are 0.53 percent and 0.17 percent of taxable payroll, respectively. Because of the size of the DI deficit, relative to its cost rate, the Trustees note that the DI program will need careful monitoring in both the short-range and the long-range periods.

*The information in this article is adapted from the **1989 Annual Report of the Board of Trustees of the Federal Old-Age and Survivors Insurance and Disability Insurance Trust Funds**, Social Security Administration, April 24, 1989. Single copies of the report may be obtained from the Office of Public Inquiries, Room 4100 Annex, Social Security Administration, 6401 Security Boulevard, Baltimore, Maryland 21235.

As shown in the 1989 Annual Report, the assets of the Old-Age and Survivors Insurance (OASI) Trust Fund increased by \$40.7 billion in calendar year 1988, reflecting, in part, the continuing growth in the economy. Including the increase of \$0.2 billion in the Disability Insurance (DI) Trust Fund, the growth in the combined trust funds, at \$41.0 billion, was about the same as the increase estimated in the 1988 Annual Report on the basis of the intermediate alternative II-A assumptions.

The trust funds are expected to continue growing for many years into the future. Based on intermediate assumptions, the combined trust funds are estimated to reach a level of about 5 or 6 times annual outgo in the next 20-30 years. Even if future experience is very adverse, the combined funds are estimated to increase to about 2-1/2 times annual outgo during the next 20-25 years. However, under such adverse conditions, the assets of the DI Trust Fund could decline to such a low level that financial problems with that fund would occur within the next 10 years.

The long-range 75-year estimates indicate that, under the intermediate assumptions, the OASDI program will experience about 3 decades of positive annual balances, with continuing annual deficits thereafter.

Based on the intermediate alternative II-A assumptions, the positive balances in the first part of the 75-year projection period nearly offset the later deficits so that the program, as a whole, has an actuarial deficit of 0.10 percent of taxable payroll. Based on the intermediate alternative II-B assumptions, the OASDI program has larger future deficits that yield an actuarial deficit of 0.70 percent of taxable payroll, which is 0.12 percent larger than in the 1988 report. However, the expected accumulation of the trust funds during the next 20-30 years provides ample time to monitor the financial status of the program and to take corrective action at some time in the future if it still appears to be warranted at that time.

During the first part of the long-range projection period, the combined OASI and DI Trust Funds are expected to accumulate rapidly to a peak fund ratio of 547 percent of annual outgo in the year 2014, based on the alternative II-B assumptions. Thereafter, the fund ratio is estimated to decline until the funds are exhausted in 2046, 2 years earlier than in last year's report. Thus, according to the alternative II-B projections, the OASDI program will have enough funds to cover expenditures for about 57 years into the future.

For OASI and DI separately, the long-range actuarial balances,

based on the alternative II-A assumptions, are +0.03 percent and -0.13 percent of taxable payroll, respectively. Based on the alternative II-B assumptions, both programs have actuarial deficits, which are 0.53 percent and 0.17 percent of taxable payroll, respectively. Because of the size of the DI deficit, relative to its cost rate, the DI program needs careful monitoring in both the short-range and the long-range periods.

Program Description

The OASDI program consists of two separate parts that pay monthly benefits to workers and their families:

- (1) Old-Age and Survivors Insurance (OASI) pays benefits after a worker retires and to survivors after a worker dies.
- (2) Disability Insurance (DI) pays benefits after a worker becomes disabled.

The Board of Trustees of the trust funds is required by law to report annually to the Congress on the financial condition of the funds and on estimated future results. The Board has five members, three of whom serve in an ex officio capacity: the Secretaries of the Treasury, Labor, and Health and Human Services. The Board also has two members of the public who are nominated by the President and

confirmed by the Senate for 4-year terms. The terms of the present public members, Mary Falvey Fuller and Suzanne Denbo Jaffe, began on September 28, 1984. They are currently serving under recess appointments, which the Senate received on January 3, 1989, after the adjournment of the 100th Congress.

Most OASDI revenue consists of contributions paid by employees, their employers, and the self-employed. (Additional contributions are paid into a separate trust fund for the Hospital Insurance part of the Medicare program. This summary focuses on OASDI and does not discuss Medicare.) The contribution rates are established by law. Contributions are paid on earnings not exceeding the earnings base—\$48,000 in 1989.

The earnings base will rise in the future as average wages increase. The current and future OASDI contribution rates for employees and employers, each, are shown in table 1.

Since 1984, a portion (not more than one-half) of OASDI benefits received by higher income beneficiaries is subject to Federal income taxation. The revenues collected as a result of this provision are transferred from the general fund of the Treasury to the trust funds.

The outgo of the OASI and DI Trust Funds consists of benefit payments and administrative expenses. Trust fund assets may not be used for any other purposes.

During periods when outgo temporarily exceeds income, trust fund assets are used to meet the shortfall. In the event of recurring shortfalls, the trust funds can allow time for legislation to be enacted to restore balance to the program. The assets of the trust funds are invested in U.S. Government

securities bearing rates of interest similar to those for long-term securities issued to the general public.

Recent Results

During 1988, about 128 million workers made contributions to the OASDI program. At the end of September 1988, 38.5 million persons were receiving monthly benefits under the OASDI program. Administrative expenses represented about 1.2 percent of benefit payments in fiscal year 1988.

Income to the OASI and DI Trust Funds in fiscal year 1988 was \$258.1 billion, while outgo was \$219.3 billion. Thus, the assets of the combined funds increased by \$38.8 billion during the fiscal year. A summary of the OASDI financial operations in fiscal year 1988 is shown below:

[Amounts in billions]

| | |
|--|---------|
| Trust fund assets at end of fiscal year: | |
| 1988 | \$104.2 |
| 1987 | 65.4 |
| Income during year: | |
| Total income | 258.1 |
| Contributions | 248.1 |
| Revenue from taxation of benefits | 3.4 |
| Payments from general fund | .1 |
| Net interest | 6.5 |
| Outgo during year: | |
| Total outgo | 219.3 |
| Benefit payments | 213.9 |
| Administrative expenses | 2.5 |
| Transfer to Railroad Retirement | 2.9 |
| Net increase in assets during year | 38.8 |

Note: Totals may not equal sums of components, due to rounding.

Actuarial Estimates

The annual report contains 75-year estimates of each fund's financial operations and status.

Table 1.—Scheduled OASI and DI tax rates: Contribution rates payable by employer and employee (each)
[Percent of taxable payroll]

| Year | Total | OASI Trust Fund | DI Trust Fund |
|----------------------|-------|-----------------|---------------|
| 1989 | 6.06 | 5.53 | 0.53 |
| 1990-99 | 6.20 | 5.60 | .60 |
| 2000 and later | 6.20 | 5.49 | .71 |

Because precise prediction of the future is impossible, alternative sets of assumptions, representing a reasonable range of possible future experience, are used to make short- and long-range estimates. Future experience could, however, fall outside the range indicated by these assumptions. Future OASDI income and outgo will depend on a variety of economic and demographic factors, including economic growth, inflation, unemployment, fertility, and mortality. These factors affect the levels of workers' earnings and OASDI benefits as well as the numbers of persons making contributions and receiving benefits.

The estimates in this article were prepared using four alternative sets of assumptions. Two sets—alternatives II-A and II-B—are designated "intermediate." Both intermediate sets share the same demographic assumptions but differ with respect to economic assumptions; somewhat more robust economic growth is assumed for alternative II-A than for alternative II-B. One set—alternative I—is designated optimistic, and another—alternative III—is pessimistic.

No single measure is used to assess the actuarial status of the OASDI funds. Short-range

measures usually focus on the adequacy of reserves available to pay benefits. Long-range measures usually focus on the balance between income and outgo during the projection period as well as the adequacy of the reserves.

The contingency fund ratio is the usual measure of the OASDI program's ability to pay benefits on time in the near future. This ratio is the amount in the trust funds at the beginning of the year, including advance tax transfers for January, divided by that year's expenditures. Thus, if the trust fund ratio is 50 percent, the amount in the fund represents about 6 months' outgo. A ratio of at least 8-9 percent is required to pay benefits at the beginning of each month. At the beginning of 1989, the fund ratio for OASDI was about 57 percent.

In analyzing the actuarial status of OASDI for the next 75 years, several different measures are commonly used. The income rate is the combined OASDI employee-employer contribution rate scheduled in the law plus the income from taxation of benefits, expressed as a percentage of taxable payroll. The cost rate is the annual outgo, expressed as a percentage of taxable payroll. The annual balance, which is the difference between the annual income rate and the annual cost rate, measures the adequacy of funding in each year of the long-range projection period. If the difference is negative, the annual balance is a deficit. The level and pattern of annual positive balances and annual deficits during various periods of time within the next 75 years measure the financial strength of the program over such periods.

If a trust fund becomes exhausted during the projection

period, the year in which the exhaustion occurs is an important measure of the financial condition of the fund.

Summarized income and cost rates over the 75-year projection period can be compared directly to measure the adequacy of the program's overall level of financing during the entire long-range period. The summarized income and cost rates reflect the full effect of interest. In addition, the trust fund balance at the beginning of the projection period, expressed as a percentage of taxable payroll, is included in the summarized income rate for the 75-year period.

The actuarial balance for the 75-year long-range projection period, is the difference between the summarized estimated income rate and the summarized estimated cost rate. If this actuarial balance is negative, the program is said to have an actuarial deficit. Such a deficit is a warning that future changes may be needed in the program's financing or benefit provisions, although it does not present a complete picture without the other measures of financing discussed here.

Short-Range Financing (1989-93)

Estimates for the next 5 years are used to assess the adequacy of OASDI financing in the short range. In this period, the numbers of persons receiving OASDI benefits can be estimated fairly accurately. Changes in the national economy, however, which are difficult to predict, can have major effects on income and outgo.

The actuarial estimates shown in the 1989 report indicate that the combined assets of the OASI and DI Trust Funds will be sufficient to pay OASDI benefits on time

throughout the 5-year period and for many years thereafter, based on all four sets of assumptions. In addition, the estimates based on alternatives I, II-A, and II-B indicate that the OASI and DI programs, separately, can operate satisfactorily for many years. During the next 10 years, however, if experience is very adverse, the assets of the DI Trust Fund could decline to such a low level that financial problems would occur.

Chart 1 shows the OASDI contingency fund ratio for 1989 (57 percent) and the projected OASDI ratios for 1990-93, on the basis of all four sets of assumptions. The fund ratios for the combined trust funds are estimated to increase each year.

Long-Range Financing (1989-2063)

Long-range 75-year estimates for OASDI, although sensitive to variations in the assumptions, indicate the trend and general range of the program's future financial status. During this long-range period, income and outgo are greatly affected by demographic, as well as economic, conditions. Most of the beneficiaries during the next 75 years have already been born, so that their numbers are projected mainly from the present population. The numbers of workers involved in these projections, however, depend largely on future birth rates, which are subject to more variability.

Several important demographic trends are anticipated, which will raise the proportion of the aged in the population during the next 75 years. First, because of the large number of persons born in the two decades after World War II, rapid growth is expected in the aged population after the turn of the

century. Second, assumed declines in death rates also would increase the numbers of aged persons. At the same time, birth rates, which began to decline in the 1960's and are assumed to remain relatively low in the future, would hold down the numbers of young persons.

Chart 2 shows the long-range trend in the number of covered workers per OASDI beneficiary. (The term "beneficiary" includes not only retired workers but also disabled workers, spouses, children, and survivor beneficiaries.) Based on the intermediate assumptions, this ratio is estimated to decline gradually from 3.3 in 1988 to 3.0 in 2010. From 2010 to 2030, the estimated ratio falls rapidly to 2.0 as the number of beneficiaries increases more rapidly than the number of covered workers. After 2030, the ratio is estimated to decline gradually.

Chart 3 shows the estimated OASDI income and cost rates for the long-range projection period, based on the intermediate II-B assumptions. During the first three decades of this period, the estimates indicate that the income rate will generally exceed the cost rate, resulting in substantial positive balances each year. Beginning about 2020, the reverse is true, with the cost rate exceeding the income rate, thus resulting in substantial deficits. These positive balances and deficits do not reflect interest earnings, which result in trust fund growth continuing for about 10 years after the first actuarial deficits occur. The cost rate is estimated to increase rapidly after the first half of the 75-year projection period, primarily because the number of beneficiaries is projected to increase more rapidly than the number of covered workers.

Chart 4 shows the projected OASDI contingency fund ratios for

the 75-year period, based on the intermediate alternative II-B assumptions. The ratio rises steadily and reaches 547 percent in 2014. After 2014, the ratio declines until the combined funds are

exhausted in 2046. The importance of the trust fund accumulating reserves is emphasized by Chart 4. As the chart shows, the buildup in the reserves will be needed later to pay benefits to the increasing

Chart 1.—Contingency fund ratio at beginning of year, 1988-93

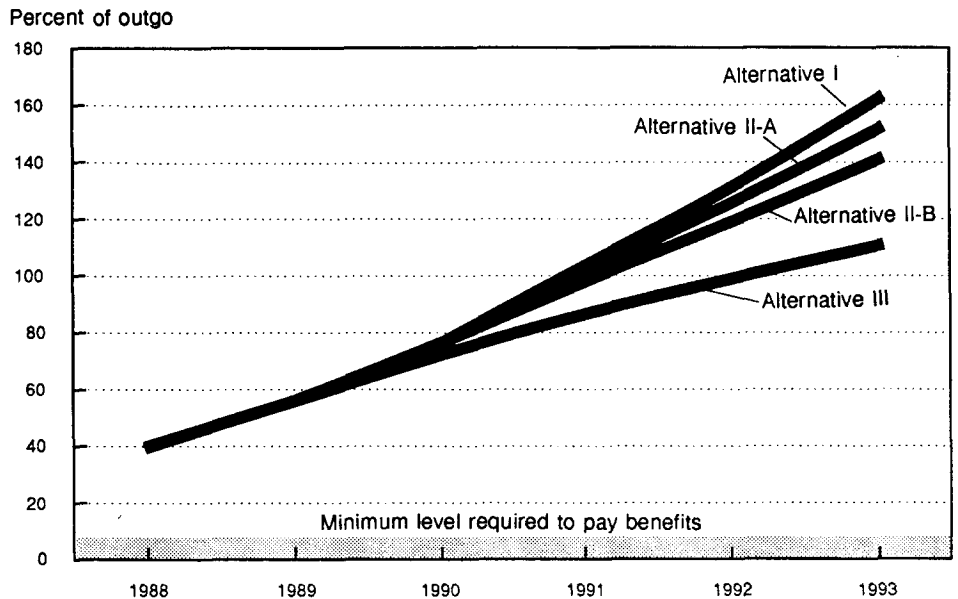

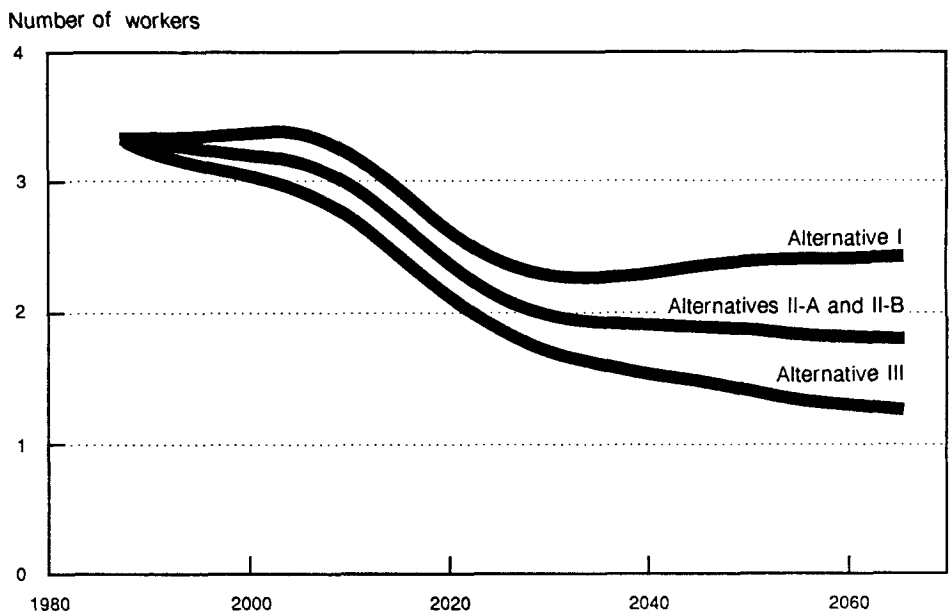

Chart 2.—Number of covered workers per OASDI beneficiary

numbers of retired persons who were born in the high birth-rate years from the mid-1940's to the mid-1960's.

Table 2 presents a comparison of the annual income and cost rates for the 75-year long-range projection period, based on the four sets of assumptions. The figures are expressed as percentages of taxable payroll.

The long-range OASDI actuarial deficit of 0.70 percent of taxable payroll, based on the intermediate II-B assumption, results from an income rate of 13.02 percent of taxable payroll over the 75-year period (including beginning trust fund balances) and a cost rate of 13.72 percent over the period. In the absence of other changes, the long-range actuarial balance will tend to worsen slowly in future annual reports, as the valuation period moves forward and additional distant years of deficit are included in the valuation. The actuarial deficits in the later years of the 75-year projection period are caused primarily by the demographic trends described above, in combination with a flat contribution rate schedule.

Table 2.—Estimated annual OASDI income and cost rates and actuarial balance for long-range projection period

| Assumption | Income rate | Cost rate | Actuarial balance |
|--------------------------|-------------|-----------|-------------------|
| Alternative I | 12.90 | 11.16 | 1.74 |
| Alternative II-A | 12.98 | 13.08 | -.10 |
| Alternative II-B | 13.02 | 13.72 | -.70 |
| Alternative III | 13.15 | 16.78 | -3.63 |

Note: Income rate, cost rate, and actuarial balance are defined in the text.
