

SOCIAL SECURITY DISABILITY INSURANCE PROGRAM WORKER EXPERIENCE

ACTUARIAL STUDY NO. 118

by Tim Zayatz, A.S.A.

Social Security Administration
Office of the Chief Actuary

June 2005
SSA Pub. No. 11-11543

FOREWORD

The most recent work dedicated to presenting actuarial experience of the Social Security Disability Insurance (DI) program is Actuarial Study #114, *Social Security Disability Insurance Program Worker Experience* (June 1999). The study examined historical data with regard to disability incidence and benefit termination over the period 1975-98. A comprehensive analysis of termination activity of the DI rolls was also presented based on 100 percent worker data collected for the 5-year period 1991-95. The overall content of Actuarial Study #118, and the methods used to prepare those results are consistent with those of the prior study; namely, disability incidence and benefit termination is examined over the period 1975-2004, and a comprehensive analysis of termination activity is presented for the 5-year period 1996-2000. Details of the underlying methodology for table construction are outlined in the appendix.

This study does not present projections of actuarial cost estimates for the DI program, which appeared intermittently in previous studies. For this information, the reader is referred to Actuarial Study #115, *Short-Range Actuarial Projections of the Old-Age, Survivors, and Disability Insurance Program* (July 2001), which was developed to provide a detailed description of the methodology and assumptions used in projecting the costs associated with the entire OASDI program. An update to that work is scheduled to appear later this year.

The study is also available on the Social Security Administration's website at www.socialsecurity.gov/OACT/pubs.html. Additional copies of the study are available upon request. Please refer to the inside cover for details. Finally, readers are welcome to provide comments or suggestions regarding any of the material contained within. Comments may be directed to Tim.A.Zayatz@ssa.gov.

*Eli N. Donkar, Ph.D., A.S.A., M.A.A.A.
Deputy Chief Actuary*

SOCIAL SECURITY DISABILITY INSURANCE PROGRAM

WORKER EXPERIENCE

I. ENTITLEMENT TO DISABILITY INSURANCE BENEFITS

After onset of a severe physical or mental impairment, a worker may become entitled to monthly disability insurance benefits under the Social Security Old-Age, Survivors, and Disability Insurance (OASDI) program, provided he or she:

- Meets the definition of disability set forth in the Social Security Act;
- Has filed a claim for disability insurance benefits;
- Satisfies the disability insured requirements of the Act;
- Has completed a 5-month waiting period; and
- Has not attained *normal retirement age*¹.

A worker's cash benefit is classified as an *award* at the time of initial payment. Additional auxiliary benefits may also be payable to other family members based on the earnings record of the entitled worker. This study analyzes the activity of disabled workers of the Social Security Disability Insurance (DI) program as described under title II of the Social Security Act.

A. Definition of Disability

For purposes of entitlement to DI benefits, *disability* is defined as the inability to engage in any substantial gainful activity (SGA) by reason of any medically determinable physical or mental impairment. The impairment must be expected to result in death or to last for a continuous period of at least 12 months. In addition, the disability must prevent the claimant from performing previous work, or engaging in any other kind of work in which a significant number of jobs exist. It is immaterial whether such work exists in the claimant's immediate area, or whether a specific job vacancy exists, or whether the claimant would be hired if he or she applied for work.

Several additional points are worth mentioning:

- The worker's impairment must be the primary reason for the inability to engage in SGA.
- The formal determination of disability is based on a sequential process defined in regulations. The first step compares actual earnings to a specified level to determine ability to engage in SGA. Absent such actual earnings evidence, the sequential process continues with an

evaluation of the nature and severity of the alleged impairment, followed by consideration of age, education, and work experience.

- An individual age 50-59 may receive disability benefits as a disabled widow(er) or surviving divorced spouse of a person who died fully insured; requirements include satisfying the same definition of disability that applies to workers.
- Disability benefits for a disabled son or daughter age 18 or over (childhood disability benefits) may be payable for a disability which began before age 22; requirements include satisfying the same definition of disability that applies to workers.
- Special provisions exist for the evaluation of insured status and disability in cases of statutory blindness.
- The same definition of disability applies when determining eligibility of adults under the Supplemental Security Income (SSI) program as described under title XVI of the Social Security Act. This means-tested cash benefits program is also administered by the Social Security Administration (SSA).

B. Disability Insured Status

To qualify for Social Security benefits for themselves and their dependents, individuals must work in employment covered by Social Security or be self-employed for a certain period of time, or have a specific amount of covered earnings in a year. Credit for this work is measured in quarters of coverage (QCs), or *credits*.²

An insured status test of the number of credits earned by a worker is required to establish a period of entitlement to any benefit. To be considered for disability benefits, a worker must satisfy *disability insured* status requirements, which consist of having obtained a requisite number of total credits as well as a specified number of credits earned in recent quarters. The worker must accrue a sufficient number of credits to be deemed *fully insured*—at least six credits and no more than 40 credits are required for this insured status.³ The recency-of-

¹ Under present law, the normal retirement age is 65 for those born in 1937 or earlier, and is scheduled to increase gradually—over two separate phase-in periods—to age 66 beginning with persons born in 1943, and age 67 beginning with persons born in 1960.

² In 2005, a worker receives one credit (up to a maximum of four) for each \$920 of annual covered earnings. This amount is indexed each year by the increase in average wages. For determining QCs, different rules apply to earnings before 1978, and a simplified method applies for the 1937-50 period.

³ A fully insured worker has at least one credit (whenever acquired) for each year starting with the year the worker attains age 22 and ending with the year before the year the worker attains age 62, becomes disabled, or dies (whichever occurs earliest)—years that are partially or fully within a period of disability are not counted.

work test is satisfied if the worker has earned at least 20 credits during a 40-quarter period that ends with the quarter in which the waiting period begins.

A special recency-of-work test for younger workers provides an alternative to the 20/40 requirement. A worker who is under a disability which began before the quarter of attainment of age 31 satisfies the recency-of-work requirement if credits were earned for at least one-half of the quarters during the period beginning with the quarter after the quarter the worker attained age 21, and ending with the quarter in which the disability began. If this period contains 12 or fewer quarters—that is, if the disability begins in the quarter the worker attains age 24 or earlier—then a minimum of six credits must be earned in the 12-quarter period ending with the quarter in which the disability began.

Note that an individual disabled because of statutory blindness is not required to satisfy the recency-of-work test. Disability insured status is granted if the worker is fully insured only.

C. Waiting Period

The waiting period for DI benefits consists of 5 consecutive full calendar months beginning with the earliest full calendar month throughout which the worker satisfied both the definition of disability and the disability insured requirements. Benefits are not payable during the waiting period. However, the waiting period is waived for individuals who had a prior period of disability, which ended within 5 years of the current period of disability. In contrast, there is no waiting period for disability benefits under the SSI program.

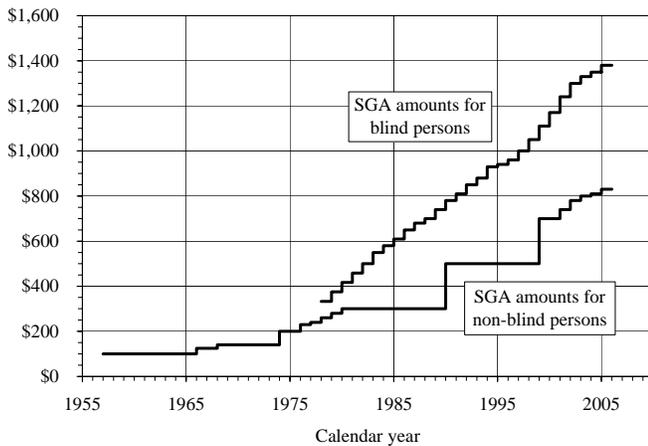

II. EXPERIENCE OF DISABILITY DETERMINATIONS

A. Substantial Gainful Activity (SGA)

Substantial work activity involves the performance of significant physical or mental duties that are productive in nature. The degree to which an impairment limits an individual's ability to perform basic work activities is essential in determining the severity of the disability. Basic work activities include: sitting, standing, walking, lifting, carrying, handling, reaching, pushing, pulling, climbing, stooping, seeing, hearing, speaking, understanding, carrying out simple instructions, using judgment, responding appropriately in a work setting, and dealing with changes in work routine.

Gainful work activity is work performed for pay or profit. Certain earnings criteria have been established as reasonable indications of whether an individual is engaged in SGA. The dollar amount associated with defining SGA is specified in Federal regulations, and was originally set at \$100 at the inception of the DI program. This amount had been updated on an ad hoc basis until January 2001, at which time the regulations were revised to provide for annual indexing of the SGA level based on the increase in average wages. From 1990 through 2000, the SGA level actually consisted of a primary amount and a lower secondary amount. Earnings above the primary amount ordinarily demonstrated SGA, whereas earnings less than the secondary amount demonstrated lack of SGA; earnings between the two amounts required consideration of all circumstances related to work activity. This tier structure was discontinued beginning in 2001. Since 1977, blind persons have been subject to a separate SGA amount.⁴ **Figure 1** shows a history of the level of SGA.

Figure 1.—Substantial Gainful Activity Amounts for the Disability Insurance Program 1957-2005

⁴ As of 2005, a blind individual earning over \$1,380 per month (net of impairment-related work expenses) is ordinarily considered to be engaging in SGA. The comparable amount for non-blind individuals is \$830 per month.

B. Impairments

To establish the presence of an impairment, an individual must provide supporting medical evidence along with the disability claim. The Social Security Administration's *Listing of Impairments* is used to determine the severity of the disability. The listings contain examples of common impairments for each of the major body systems that are deemed to be of such severity as to prevent a person from performing SGA. However, a diagnosis of a listed impairment alone may not be sufficient to establish disability; associated symptoms, clinical signs, and laboratory findings must accompany it. In addition, claimants are asked to provide the names of employers and job duties for the last 15 years.

Many individuals are found to be disabled even though impairments fail to meet the level of severity required in the impairment listings. In these cases, an individual's medical condition is evaluated in conjunction with age, education, and job skills. These *vocational factors* are given increasing weight with the advancing age of the worker, and are particularly significant in the determination of disability among workers age 50 or older.

The leading diagnostic categories for disability vary by gender and year of award. **Table 1** shows the leading causes among DI disabled workers. Ranked by overall percentage, musculoskeletal disorders represent the largest single category of impairment, accounting for 24.4 percent of all awards over the period 1998-2002. As the baby-boom generation (birth cohorts 1946-64) continues to age, arthritic, back, and bone disorders are expected to become increasingly more prevalent. It is anticipated that the DI program will continue to experience a growing proportion of awards in this impairment category. Also note that the jump in the percentage of musculoskeletal impairments in 1995 can be explained by a change in reporting method. Prior to 1995, the Office of Disability (OD) reported the diagnosis of all awards based solely on the distribution of allowances at the initial level. In essence, allowances at the appeals level were assumed to have the same distribution among impairment categories as those at the initial level. In 1995, OD began reporting the actual diagnosis of all awards at all levels of review. This change revealed a significantly higher percentage of musculoskeletal impairments at the appeals level. The accompanying drop in the percentage of mental impairments in 1995 suggests that at least some of the awards in this category were among those misclassified under the old reporting method.

Mental impairments rank second in overall percentage, accounting for 23.8 percent of all awards, and continue to have the highest percentage among females for the 5-year period ending in 2002. Mental disorders had been the leading cause of

disability for both sexes until being displaced by musculoskeletal disorders in 1996. However, mental impairments became the leading cause again in 2001. This may be due, in part, to a special administrative initiative. Effective in that year, SSA began conducting a review of SSI recipients who are potentially eligible for DI benefits due to previously unrecognized disability-insured status. Many of the resulting awards were found to be individuals under age 35 who were diagnosed with a mental disorder. Although review of this special disability workload is expected to continue for a number of years, the impact on specific impairment categories is uncertain. Also note that revised listings for mental impairments (published in 1985) led to the re-adjudication of a large number of cases, resulting in a jump in new awards in 1986.

Among males, circulatory disorders have always been a leading cause of disability, accounting for roughly 14-16 percent of total awards over the last 10 years. Neoplastic disorders have also been steady in recent years, accounting for roughly 9-11 percent of total awards. An age comparison within these two categories reveals nearly five times as many circulatory impairments among those age 50 or older compared with those age 35-49; and three times as many neoplastic disorders for the same age distribution. Although medical advancements continue in these categories, the large disparities show that these types of impairments will continue to significantly impact the DI rolls as the baby-boom ages. Finally, the percentage of awards based on infectious disease has decreased significantly over the last 5 years, mainly due to the marginalized impact of HIV infection.

Awards based on neoplastic and metabolic impairments rank higher among females than males, whereas awards based on circulatory impairments rank lower. Higher prevalence of cancer, and hormonal and eating disorders, as well as increasing prevalence of diabetes among females may account for this. Note that the impairment listings were changed in 1999 to eliminate awards based solely on obesity, accounting for the large decline in the percentage of nutritional and metabolic impairments beginning in 2000.

C. Determination Process

At the initial stage of a claimant's request for disability benefits, the State Disability Determination Services (DDS) will make a decision to allow or deny the claim. A claimant who is dissatisfied with the initial decision may request further review. This review process consists of several steps, which must be requested within specified time intervals, and in the following order:

- The claimant may request the reconsideration of an initial decision. This entails re-examination of administrative records, with the opportunity to submit new material evidence supporting the claim.
- If disagreement persists after the reconsideration, the claimant may request a hearing before an administrative law judge (ALJ) of the Office of Hearings and Appeals (OHA).
- If disagreement persists after the ALJ decision, the claimant may request a review by the Appeals Council of OHA, and then may pursue civil action in a Federal district court.

Table 2 presents data on the disposition of claims for DI disability benefits across the various review stages, for calendar years 1993-2004. The data are tabulated by year of filing, with an additional break out by program involvement—showing claims for DI benefits only, or concurrent entitlement to DI and SSI benefits. As mentioned earlier, both programs use the same definition of disability for adults. However, eligibility for SSI benefits is further dependent upon the claimant's countable assets and income, which may include DI benefits.

Many factors exist that affect the number of disability claims filed as well as the frequency of subsequent decisions to either allow or deny benefits. However, the impact of any one factor is difficult to gauge; in general, they may be administrative, economic, or demographic in nature. Below is a list of some of the leading determinants which may have a significant impact on both the number of claims filed and the rate of favorable determinations⁵:

- Legislative changes to the program;
- Revisions to disability guidelines or impairment listings;
- Medical advancements or breakthroughs in the treatment of specific disorders;
- Changes in medical evidentiary requirements and diagnostic trends;
- Technology that can enhance the ability to work;
- Actions by Federal, State, and local governments to increase program awareness and encourage enrollment;
- Demonstration projects and initiatives that offer work incentives to applicants in lieu of awarding disability benefits;
- Changes in the SGA amount;
- National health threats such as HIV;
- Strength of national and regional economies;
- Employment shifts in part-time work or level of labor force participation, affecting disability insured status;
- Demographic shifts such as the aging of the baby-boom;

⁵ Discussed in greater detail in *The Social Security Disability Insurance Program—an Analysis* (Department of Health and Human Services, December 1992).

- Level of administrative funding and the ability to control current caseloads and backlogs;
- Public pressure on program policy, which may lead to changes in regulations or legislative action;
- Level of court involvement in the appeals process;
- Results of appeals and class action suits challenging SSA's interpretation of the law.

D. Applications

The number of DDS claims for DI disabled worker benefits declined steadily from 1.25 million in 1994 to 1.04 million in 1998. Some factors contributing to the decline in this period include a robust economic expansion and lower levels of unemployment; leveling off of female labor force participation; a decline in HIV-related impairments; and the elimination of drug addiction and alcoholism as material causes for disability.

Over the following 6 years, the DI program experienced nearly a 43 percent increase in applications to an estimated 1.49 million in 2004, with roughly a 10 percent increase alone in each of 2001 and 2002. This increase in DDS claims is not fully understood, except in general terms. Having an obvious impact is the aging of the baby-boom, which continues to progress through the peak ages of disability; and higher levels of unemployment resulting from the economic contraction which began in the second quarter of 2001. A small portion of additional claims come from the review of the special disability workload of SSI recipients who may be eligible for DI benefits, as previously mentioned.

E. Initial Decisions

From 1992 through 1995, the allowance rate declined even as application growth continued. This may be indicative of claimants—caught in the economic downturn of a post-recession period—exhibiting less severe impairments. The result was fewer allowances from a growing number of claims. It is worth noting that allowance rates tend to be much lower among those concurrently filing for DI and SSI benefits than those filing for DI benefits only. This may be due to differences in the composition and economic status of the filers. Concurrent filers tend to be of lesser means (reflective of the nature of the SSI program) and are thus more likely affected by changes in the economy. Many times the only alternative is to seek aid from Federal, State, or local programs. Consequently, concurrent filers may exhibit less severe disability, or provide less evidence of impairment, resulting in fewer allowances.

Also note that for years with pending decisions, the ultimate allowance rate will be lower than that shown in table 2. This is due to the greater processing time involved in unfavorable decisions.

F. Reconsideration

Allowance rates at the reconsideration level have been very consistent. Although the reconsideration stage is *de novo*⁶ in concept, it is similar to the initial stage in that disability determination is mostly a “paper review” process where claimants are rarely observed by the decision-maker. Assuming some uniformity among the initial decision-makers, it follows that initial denials are seldom overturned at reconsideration.

Currently 10 States are participating in a test of the *Prototype Model* to redesign the disability determination process. Features of this model include elimination of the reconsideration step, along with use of a single decision-maker and process enhancements at the DDS and OHA levels. The results shown in table 2, therefore, reflect a mixture of experience for the standard decision model and the modified test process. The Prototype Model test is set to expire on December 31, 2005.

G. Appeals Beyond Reconsideration

The subjectivity inherent in assessing disability leaves considerable room for interpretation of evidence. As a result, overturned decisions at the OHA level and beyond remain relatively high. Factors that contribute to the high reversal rate include:

- A group of decision-makers different from those used at the initial and reconsideration stages;
- Worsening of alleged disability over time;
- Use of legal representation and the opportunity to submit new material evidence supporting the claim; and
- Initial face-to-face contact with decision-makers.

Class action suits can also have an impact on the determination process. Public pressure has surfaced in controversial areas such as mental impairment issues; the amount of leverage given to allegations of pain; statements by treating physicians in the absence of clinical evidence; how HIV-related impairments and cardiovascular diseases are evaluated; use of vocational factors in the absence of a single debilitating impairment; and the consistency of DDS decisions with SSA policy. Although the number of claimants directly involved in any one case may not be large, the outcome may have a broader and subtler influence on subsequent rulings and determinations.

Finally, Federal efforts aim to improve the disability determination process by striving to reach the proper determination at the earliest possible stage. This effort will help to maintain manageable backlogs, as well as reduce the rate of overturned decisions at the OHA level.

⁶That is, a case is reviewed in its entirety and a new decision is made unrelated to the initial decision.

III. EXPERIENCE OF DISABILITY INCIDENCE

A. History

Since the commencement of disability cash benefits in July 1957, dynamics of the DI program have been subject to many internal and external factors. Congressional action, public opinion, and court rulings have shaped program characteristics including: how disability is defined; the determination of entitlement; the level of benefits; the review process of current beneficiaries; and ultimate program cost. Prior to 1960, the DI program applied only to workers age 50 or older. Prior to 1965, a claimant needed to be permanently disabled to qualify for benefits. The *Social Security Amendments of 1967* (Public Law 90-248) eased the insured status requirements for persons under age 31, allowing a substantial number of young beneficiaries to enter the rolls. From 1968 through 1970, disability incidence remained fairly stable; however, through the early 1970s program growth far exceeded any reasonable expectations.

The introduction of the Black Lung program (1970) and the SSI program (1974), and a severe economic recession (1974-75) led to hundreds of thousands of new disability claims. In addition, administrative policy also tended to change as the DI program became bigger and more complex. Notably, the SSI program generally requires applicants under the age of 65 to apply for benefits from all other programs including DI, which may partially or fully offset SSI benefits. As expediency in processing applications was naturally given high priority, central office review of DDS initial decisions fell to roughly 5 percent in 1972 from 100 percent prior to 1972. The increased public awareness and pressures of administering two new programs probably contributed significantly to the sharp increase in new awards from 1972 to 1976.

The *Social Security Amendments of 1977* (Public Law 95-216) and the *Social Security Disability Amendments of 1980* (Public Law 96-265) also had a significant impact on the DI program. The 1977 amendments changed the benefit formula used to calculate benefits awarded in 1979 and later. The 1980 amendments introduced a more restrictive limit on the total monthly amount of Social Security benefits payable on a disabled worker's account; and mandated a 65 percent review rate of DDS allowances to assure uniformity of decisions. The return to high levels of review during this period led the DDSs to give increasingly careful consideration to new allowances, and increased the chances of reversing an initially favorable decision. These circumstances contributed to steadily declining awards from 1977 through 1982.

By 1984, DI program policy had undergone another reversal. Congressional and public concern over the removal of a large number of beneficiaries (particularly the mentally impaired) resulted in an administrative moratorium on the review of the disability rolls while Congress considered new DI legislation.

Many beneficiaries whose benefits had been terminated were returned to the rolls through the appeals process. This initiated a period of increased court appeals and class action suits. In response, Congress passed the *Social Security Disability Benefits Reform Act of 1984* (Public Law 98-460). Provisions of the Act include: revised mental impairment standards; increased emphasis on treating physician opinion; emphasis given to the combined effects of multiple impairments in the absence of a single severe impairment; required proof of medical improvement prior to termination of benefits; and standards to evaluate pain.

B. Recent Experience

Table 3 shows the total number of DI disabled workers awarded benefits grouped by *calendar age*⁷ at time of award, for calendar years 1980-2004. These awards are also illustrated in **figure 2**.

Figure 2.—Disabled Worker Awards by Age Group, Calendar Years 1980-2004
(In thousands)

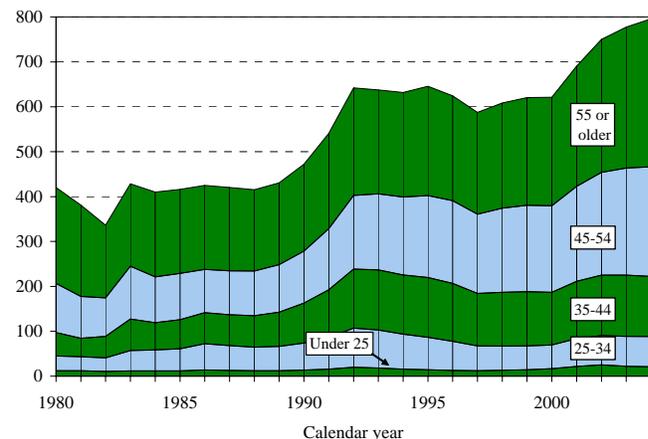

Table 4 shows the associated disabled worker incidence rates, which are expressed as annual awards per thousand disability insured not already receiving benefits. Adjusted figures are expressed as age-adjusted (male and female) or age-sex-adjusted (total) relative to the exposed population as of 2000. Tables 3 and 4 are tabulated as of the year the beneficiary is added to the rolls. Note, however, that the year of award may actually be different from the year of disability onset or entitlement. This is due to factors such as the waiting period, the nature of the determination process, and claims processing times in general. Consequently, the incidence rates shown are not necessarily representative of true morbidity rates for the stated calendar years.

⁷ Calendar age is the integral age attained on the birthday in the year in which the individual is awarded benefits.

The incidence of disability increases considerably among workers beginning at age 50. The chance of DI entitlement increases naturally with advancing age, but also as a result of greater consideration given to vocational factors. This program characteristic continues to have a significant impact on costs as the baby-boom generation progresses through ages of higher incidence. Note that the rates shown in table 4 for ages 60 and older are likely to understate the true incidence of disability since, beginning at age 62, a disabled worker may elect to forgo disability benefits, opting instead to receive reduced old-age benefits. A number of factors influence this decision, including: the disability waiting period (old-age benefits are payable immediately); the potential for worker's compensation offset; differences between disability and old-age maximum family benefits payable; and the possibility for denial of disability benefits.

Age-specific disability incidence among female workers is typically lower than males. However in 1997, female incidence began to exceed that for males at ages 35-54. Although both genders experienced a general decline in incidence in this age range over the following five years, the decline is more pronounced among males. This is likely due to the elimination of drug and alcohol addiction from the DI rolls and a sharp decline in HIV impairments, both of which are predominantly male incidence categories. It is also interesting to note that the decline in incidence rates among females did not necessarily translate into a decline in the number of benefits awarded in this specific age range. This is due to the relatively large increases in female labor force participation. Over the 10-year period ending in 1996, labor force participation rates among females age 35-54 increased between 3.5-10.0 percentage points resulting in an additional 10.7 million disability insured. Over the same period and age range, male labor force participation decreased by roughly 2.0-2.5 percentage points.

Some of the same factors that affect the number of DI applicants can also affect incidence rates. In general, the decline in incidence between 1975-82 is attributable, in part, to a stricter program. Following a very low-growth period in incidence from 1983-89, the program experienced a surge in claims beginning in 1990, and incidence rates rose significantly and remained relatively high through 1995. In the late 1990s, the prevailing economic and political environment was character-

ized by robust economic expansion, low unemployment, and legislative restrictions on the qualifications of certain impairments. In addition, advancements in medical treatment; public need for employer-sponsored healthcare protection; and pursuit of financial goals for retirement may have provided incentive to remain in the labor force, if possible. These factors contributed to the decline in applications and awards during this period.

The sharp increase in incidence rates over 2001-04 represents a notable departure from the experience of the late 1990s, which generally showed modest annual declines in the age-sex-adjusted rate. While the aging of the baby-boom is always recognized as a factor in program growth, the increase in incidence in 2001 is likely due in large part to the severe economic contraction experienced in that year. However, special administrative activity by SSA beginning in 2001 has also contributed slightly to the surge in awards. As previously mentioned, the special disability workload was the result of discovering a substantial number of SSI recipients whose disability-insured status was not previously recognized. As this caseload is processed over the next several years, the resulting disability awards will contribute to temporarily higher incidence rates than would be expected from current underlying trends.

Table 5 presents historical termination data for disabled workers. Termination experience is discussed in detail in the next section.

Table 6 shows the number of disabled workers in current-payment status, at the end of calendar years 1980-2004. The *current-payment* population is derived from the *in-force* beneficiary population (not shown), which is reduced by the number of entitled individuals whose benefits are *suspended*. Common reasons for the suspension of DI benefits include: engagement in SGA following completion of a trial work period; worker's compensation offset; or imprisonment. Over the period 1983-2004, the current-payment population has grown at an average annual rate of roughly 4.3 percent, as growth in awards has steadily outpaced growth in terminations. Note that as a consequence of the scheduled increase in normal retirement age, there appear DI beneficiaries age 65 or older for the first time in 2003. The following table summarizes the progression of the DI rolls.

Growth in the DI disabled worker rolls
(Grouped by selected calendar periods¹)

Calendar period	Disability insured ²			Awards		Terminations		Current-payment		
	Number beginning of period	Number end of period	Annual growth rate ³	Number	Annual growth rate ⁴	Number	Annual growth rate ⁴	Number beginning of period	Number end of period	Annual growth rate ³
1976-1978	85,305,000	93,701,900	3.2%	1,611,143	-5.8%	1,216,903	9.3%	2,487,630	2,878,152	5.0%
1979-1983	93,701,900	105,380,900	2.4	2,006,327	-1.7	2,315,455	1.1	2,878,152	2,564,071	-2.3
1984-1989	105,380,900	118,061,700	1.9	2,517,254	0.1	2,169,479	-4.0	2,564,071	2,890,569	2.0
1990-1998	118,061,700	134,653,500	1.5	5,390,228	4.2	3,537,039	1.7	2,890,569	4,690,942	5.5

IV. EXPERIENCE OF DISABILITY BENEFIT TERMINATION

A. Background

The reasons for termination of DI disabled worker benefits can be grouped into four main categories:

- Death of the beneficiary;
- Recovery—beneficiary no longer meets the standards used to define disability, including medical recovery or return to work;
- Conversion—disability benefit is converted to an old-age benefit upon attaining normal retirement age; and
- All other reasons⁸.

Generally, the final month of entitlement to disability benefits for a worker is the earliest of the following:

- The month before the month in which the worker dies;
- The month before the month in which the worker attains normal retirement age; or
- The second month after the month in which the beneficiary recovers⁹.

The law contains several provisions for individuals who wish to return to work, but continue to have a disabling impairment:

- Trial work period;
- Extended period of eligibility;
- Extension of Medicare coverage;
- Expedited reinstatement; and
- Waiver of the waiting period.

The *trial work period* (TWP) is a 9-month period—not necessarily consecutive—during which an entitled beneficiary may work without affecting the right to benefits. Earnings during the 9 months are not counted toward SGA, and benefits will continue as long as the beneficiary has not medically recovered.

Individuals who continue to have a disabling impairment following the 9-month TWP, receive an *extended period of eligibility* (EPE). Earnings during the EPE are counted toward SGA, and monthly benefits will not be paid when such earnings exceed the SGA limit. If earnings fall below the SGA limit anytime during the EPE, benefits are automatically reinstated. Effective January 1, 1988, the law was amended to lengthen the EPE from 15 months to 36 months for individuals entitled to benefits in January 1988 or later.

After 24 months of disability entitlement, a beneficiary becomes eligible for Medicare coverage—regardless of age—and receives services as long as DI entitlement continues. In the case of an individual engaging in SGA, coverage is provided throughout the TWP and EPE. Medicare benefits were further extended through a provision of the *Ticket to Work and Work Incentives Improvement Act of 1999* (Public Law 106-170)—effective October 1, 2000, coverage for beneficiaries who return to work will continue for an additional 4 1/2 years beyond the EPE.

The Ticket to Work Act also allows certain previously entitled individuals to request *expedited reinstatement* (EXR) of disability benefits when a disabling impairment no longer permits the performance of SGA. The provision provides a safety net for those who successfully return to work and, consequently, lose entitlement to disability benefits. EXR allows an individual to request reinstatement without filing a new application, and provides up to 6 months of provisional (temporary) cash benefits while SSA conducts a medical review to determine whether the individual can be reinstated. The request for reinstatement must be filed within 5 years of the termination of disability benefits. EXR became effective January 1, 2001.

Special provisions are granted to persons experiencing multiple periods of disability. Individuals who become re-entitled to benefits within 5 years of the end of a previous period of disability are not required to satisfy the 5-month waiting period. In addition, the 24-month waiting period for Medicare coverage need not be consecutive months and time may accrue over multiple periods of disability.

Beginning at age 62, a disabled worker may elect to receive old-age benefits in lieu of disability benefits. Although most disabled beneficiaries elect to receive DI benefits until normal retirement age—at which time conversion to benefits payable under the Old-Age and Survivors Insurance (OASI) program occurs automatically—some choose to switch earlier. This decision is influenced by economic as well as personal factors. One of the most common reasons is the existence of benefits payable outside the DI program. For example, worker's compensation benefits may partially or totally offset a DI benefit, but would not affect an OASI benefit. Another common economic factor is the difference in maximum family benefits payable under the DI program, which may be lower than the maximum payable under the OASI program. Personal factors may include the beneficiary's own assessment of health and life expectancy.

Recovery from disability may occur when the beneficiary either notifies SSA of an improved disabling condition, demonstrates the ability to engage in SGA, or is judged to no

⁸ Reasons for termination in this category include: beneficiary converts to old-age benefits prior to normal retirement age; withdrawal of application; or erroneous entitlement.

⁹ Benefits may continue if the individual is currently enrolled in a vocational rehabilitation program, or has entered an extended period of eligibility.

longer meet the definition of disability. The DDS or the central office will conduct a *continuing disability review* (CDR) from time to time based on warranting situations such as:

- Maturing of a scheduled CDR diary date;
- Posting of substantial earnings¹⁰; or
- Voluntary or vocational rehabilitation reports of an improved disabling condition.

Certain “outside” variables such as disability caseloads, backlogs, budget restrictions, and legislation can have an impact on CDR activity and disability recovery rates in general, without actually affecting the underlying rate of medical improvement. These factors shape the prevailing administrative policy and can exert considerable influence on the nature of allowances, and the degree of overall impairment-severity of the DI rolls. To a lesser extent, mortality rates are also affected by exogenous variables. For example, the elimination of drug and alcohol related impairments, and an increase in allowance based on vocational factors or mental impairments may lead to an improvement in the overall mortality profile of the DI rolls.

B. History

Many variables can affect the rate at which beneficiaries are terminated from the disability rolls, including:

- Overall improvements in disability mortality;
- Advancements in medical treatments and technology which enhance the ability to work;
- Changes in regulations that affect the makeup of the rolls;
- CDR activity;
- Vocational rehabilitation support and return-to-work incentives;
- Court decisions and the level of legal representation and appeal.

The *Social Security Amendments of 1965* (Public Law 89-97) modified the definition of disability by replacing the requirement of permanent disability with the expectation that the disability last at least 12 months. This led to the entitlement of less seriously impaired claimants and lower mortality rates among the disabled. The 1967 amendments eased the insured status requirements for claimants under age 31. A growing portion of younger and relatively healthier beneficiaries further contributed to the decline in the mortality rates of the DI rolls.

As mortality rates fell in the early years of the program, the gross recovery rate generally increased. With the introduction of government-funded rehabilitation programs, elimination of the “permanently disabled” condition, and the extension of benefits to younger claimants, the recovery rate among benefi-

ciaries rose from 19 per thousand in 1965 to 32 per thousand by 1967. Thereafter, the gross recovery rate decreased rapidly through 1975. This was due in large part to changes in the administration of the program. With the introduction of the Black Lung and SSI programs in the early 1970s, workload pressures resulted in the suspension or curtailment of some administrative review procedures. For example, by 1972 the central office reviewed only 10 percent of DDS continuances in which medical recovery was expected. Previously, 100 percent of such continuances were reviewed. By 1976, the gross recovery rate began to increase again as central office review of continuances returned to 100 percent.

Throughout the 1970s, the DI program experienced substantial increases in cost, mainly the result of significant growth in incidence. Under then-current policy, reviews were performed only in those cases where the beneficiary’s condition was expected to improve, or voluntary reports or posted earnings indicated work activity. However, by the late 1970s measures to curtail inaccurate award determinations and improve the review process were intensified. One significant provision of the 1980 amendments required that beneficiaries with non-permanent impairments be reviewed every 3 years, and permanently disabled beneficiaries be reviewed at intervals determined by the Commissioner. Using that legislative mandate, the Reagan Administration initiated a major review of the disability rolls that resulted in a large number of cases in which it was determined that recovery had occurred.

Ensuing public disapproval of the newly implemented review process led to a moratorium on reviews of all cases of mental impairment disability.¹¹ Revision of mental impairment criteria and the review process followed and more than half of those removed from the rolls were reinstated upon appeal. The result was a sharp drop in recoveries as well as a sharp increase in new awards throughout the remainder of the 1980s.

C. Recent Experience

In the latter part of the 1980s, the agency experienced reductions in both work force and administrative funding. By the early 1990s, there existed a shortage of personnel needed to handle a significant increase in claims, as well as to meet review schedules. In an effort to free up resources to process initial claims, the agency sharply curbed the review of existing beneficiaries. Beginning in 1994, growth in initial claims began to level-off and once again attention shifted to performing mandated reviews. Congress enacted the *Contract With America Advancement Act of 1996* (Public Law 104-121), which included a provision authorizing the appropriation of funds to be used exclusively to conduct additional CDRs. As intended, the special funding helped to eliminate DI backlogs

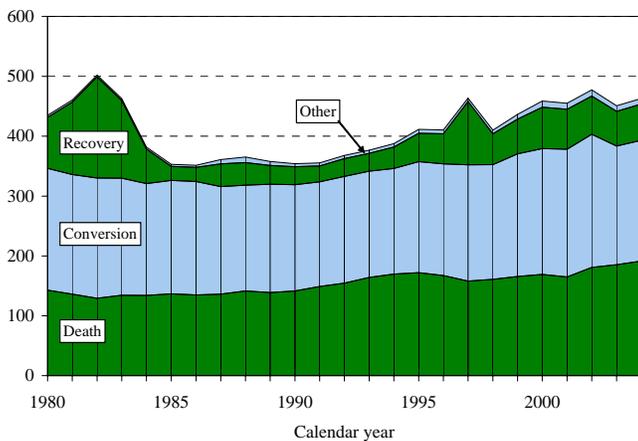

¹⁰ The aforementioned Ticket to Work Act prohibits initiation of a CDR during the period that a beneficiary is using a ticket; and under certain circumstances, prohibits the use of work activity as a basis for review. Provisions are effective January 1, 2002.

¹¹ The moratorium applied to all cases on which an administrative or judicial appeal was pending on or after June 7, 1983. All persons claiming benefits based on mental impairment disability who received an unfavorable decision after March 1, 1981 were permitted to reapply within time constraints, as mandated in 1984 by Public Law 98-460.

by the end of 2000, and to become essentially current in the processing of SSI-only CDRs by the end of 2002. Since then, administrative budget delays have caused the agency to fall behind in processing certain SSI CDRs, emphasizing the need for renewed funding and revised scheduling plans.

Table 5 shows the historical number of terminations and gross termination rates for disabled workers, by reason for decrement. As evident from the data, most terminations occur as a result of death or conversion. With the exception of a sharp decrease in conversions in 2003¹², both categories exhibit steady long-term trends with little variation from year-to-year. In contrast, the number of recoveries can deviate considerably from a somewhat normal level. As previously mentioned, exogenous variables can greatly impact this category—and consequently the recovery rate—without actually affecting the underlying rate of medical improvement. As an example, we see that a spike in recoveries occurred in 1997 as the result of a provision of Public Law 104-121, which eliminated drug and alcohol addiction from the impairment listings and explicitly denied benefits in cases where drug or alcohol addiction were contributing material factors to the disability. Although categorized as “recoveries”, this group of beneficiaries was simply eliminated from the rolls due to a change in law. “Other” is a relatively small category comprised mostly of individuals who switch to old-age benefits prior to normal retirement age. **Figure 3** shows the distribution of DI disabled worker terminations by reason.

Figure 3.—Disabled Worker Terminations by Reason, Calendar Years 1980-2004
(In thousands)

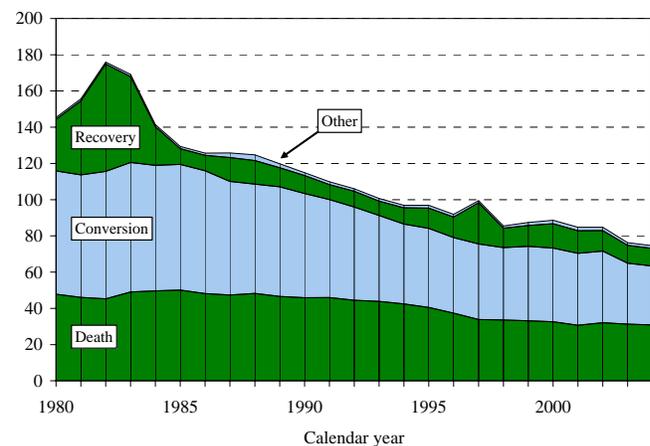

As mentioned, death and conversion account for most of the terminations that occur, and the general trend in termination rates has been downward. **Figure 4** shows the distribution of DI disabled worker termination rates by reason. Several trends

in the disability rolls have developed over the years which help explain the decline: mortality improvements and a reduction in the average age of beneficiaries.

Over the period 1980-95, the average age among male disabled workers in current-payment status steadily declined from 52.8 to 49.8 years. The proportion of the DI rolls made up of beneficiaries aged 35-49 grew from 20 percent in 1980 to 34 percent in 1995, while the proportion of 50-64 year olds fell from 71 percent to 55 percent. Similar trends were experienced among female disabled workers as the average age declined from 53.7 to 49.9 years. Higher incidence of mental disorders has led to an increase in younger and (physically) healthier beneficiaries. The result is fewer deaths, as well as a smaller percentage of beneficiaries converting to old-age benefits each year.

Since 1995, the average age among disabled workers in current-payment status has steadily increased. In 2004, the average age of disabled males was 51.6 years. The proportion of the DI rolls made up of beneficiaries aged 35-49 declined slightly to 29 percent, while the proportion of 50-64 year olds grew to 62 percent. Similar trends were experienced among female disabled workers as the average age climbed to 51.4 years. Note that the increase in average age is mostly an effect of the aging baby-boom generation and has not yet resulted in any significant increase in conversions. The trend in termination rates continues to be downward, in large part due to mortality improvements, as well as the scheduled increase in normal retirement age.

Figure 4.—Disabled Worker Termination Rates by Reason, Calendar Years 1980-2004
(Per thousand exposed)

Medical progress has significantly contributed to longer life expectancy among the general population. Certain advancements have also had a considerable, albeit less quantifiable, impact on selected segments of the disability population. Over the period 1980-89, the DI rolls show gross rates ranging from roughly 50-55 deaths per thousand males, and 35-40 deaths per thousand females. Throughout the early 1990s, mortality grad-

¹² This decrease is attributable to the scheduled increase in normal retirement age, resulting in the deferral of a portion of old-age conversions from 2003 to 2004.

ually improved. A noticeable decline in the death rate after 1995, especially among males, is due in part to the rapidly diminishing impact of HIV-related impairments and the elimination of drug and alcohol addiction from the impairment listings. Other significant trends leading to a lower mortality profile of the disability rolls include: increasing prevalence of musculoskeletal and mental impairments, which tend to be less life-threatening than circulatory or neoplastic disorders; advancements in the treatment of malignant growths; and a greater proportion of awards to older workers, whose determinations are based on a set of vocational factors rather than a single severe disability. Over the period 2000-04, the DI rolls show stable gross rates of roughly 35 deaths per thousand males, and 26 deaths per thousand females.

D. Death Experience (1996-2000)

Tables 7A-7C show the probability of death for male and female DI disabled workers, by *select age* at entitlement to disability benefits; and *duration*—measured in years since selection. Data reflect the actual experience of the DI rolls from January 1, 1996 through December 31, 2000. The methods used in table construction and graduation are detailed in the appendix.

Mortality among disabled workers generally increases with select age. For any given select age, the probability of death is greatest during the first year of entitlement, then decreases dramatically during the second and third years of entitlement. Death probabilities tend to level off sometime around the fifth or sixth duration for males, and the third or fourth duration for females. For older select ages, mortality is lowest at these durations before trending upward in the later durations as general demographic factors such as age of the beneficiary begin to have an increasing effect. Greater consideration given to vocational factors, especially after age 50, may cause a slight decline in mortality. Disability mortality among males is higher than females for virtually all attained ages. Unique data considerations affecting estimates of disability mortality—such as death during the waiting period and tracking DI beneficiaries upon conversion to old-age benefits—are discussed in the appendix.

An analysis of broad age categories may explain some of the trends and characteristics of disability mortality. Disabled males under age 35 show the highest concentration of mental disorders, infectious and nervous impairments, and injuries. Disabled males aged 35-49 show a consistent mix of various impairments following the predominant mental and musculoskeletal categories; an increase in circulatory and neoplastic impairments is apparent. Disabled males aged 50 or older show the highest concentration of musculoskeletal awards, along with considerable increases in circulatory, neoplastic, and respiratory disorders; though still an important category, the prevalence of mental impairments is down considerably from the younger age groups.

Females show comparable trends in broad age categories with a few categorical changes. Disabled females under age 35 show the highest concentration of mental disorders—over 43 percent of new awards occurred in this category in 2002. Disabled females aged 35-49 continue to show high incidence of mental and nervous impairments, along with large increases in musculoskeletal and neoplastic disorders. Disabled females aged 50 or older show the highest prevalence of new awards in the musculoskeletal, mental, and neoplasm categories.

Due to the many reasons already discussed, disability mortality over the 5-year period covered in this study (1996-2000) has improved for roughly 80 percent of all attained ages among male and female beneficiaries, when compared to the previous 5-year period (1991-95)¹³. Among males, mortality in the more recent period is generally 5-20 percent lower than mortality in the earlier period, with dramatic reductions of 35-45 percent at some younger select ages. The improvements at the younger ages are largely due to advancements in HIV treatment and legislation eliminating drug and alcohol addiction from the impairment listings. Mortality improvement among females is as widespread but less dramatic as that seen among males, generally ranging from 5-15 percent lower than the earlier period.

Tables 8A-8C show the progression of a series of cohorts—each for a given select age—reflecting the probabilities of death shown in tables 7A-7C. These *survival tables* are a concise way of representing the probabilities of a particular population living to a particular age. See appendix for details on table construction and usage.

Tables 9A-9C show the expected future lifetime of DI disabled workers. Values are based on the survivorship experience shown in tables 8A-8C. As with the general population, disabled females display a higher future lifetime than males. Note that life expectancy is generally greater during the second or third year of entitlement than during the first year of entitlement. This is due to relatively higher mortality rates within the first several years of disability, after which workers seem to show a greater propensity for disability continuation or non-death termination.

Tables 10A-10C show the *absolute rate of death* per thousand entitled disabled workers. These rates are derived from the probabilities of death shown in tables 7A-7C, and represent a different concept in measuring the rate of termination from the DI rolls. Absolute rates consider only the effect of a single decrement in a multiple-decrement environment, reflecting the probability of survival and ultimately termination under that one decrement. These are not true probabilities and as such are expressed on a “per thousand” basis. See the appendix for further details.

¹³ Findings are based on comparisons with disability mortality as discussed in Actuarial Study No. 114: *Social Security Disability Insurance Program Worker Experience* (Zayatz, June 1999).

Tables 11 and 12 show the aggregate probability of death and expected future lifetime, by *select* and *attained* age. Probabilities are based on aggregate counts of exposure and deaths across all durations. They represent the average probability of death within one year for beneficiaries originally entitled at a particular select age (table 11), or who have attained a particular age (table 12). Similarly, aggregate future lifetime represents the average life expectancy of beneficiaries for a particular select or attained age. Values are exposure-weighted averages of the select-and-ultimate future lifetimes shown in tables 9A-9C.

Table 13 shows the aggregate probability of death and expected future lifetime, by *duration*. Probabilities are based on aggregate counts of exposure and deaths across all select ages, and represent the average probability of death within the next year of entitlement to disability benefits. Aggregate future lifetime represents the average life expectancy of beneficiaries who have been entitled for the stated number of years.

E. Recovery Experience (1996-2000)

Tables 14A-14B show the probability of recovery for male and female DI disabled workers, by select age and duration. In general, chances of recovery decline with advancing select age. For any particular select age, the probability of recovery exhibits a bimodal distribution. Disability recovery tends to peak during the second year of entitlement before declining the following year, then peaks again at its maximum level in the fifth year of entitlement before declining thereafter. This effect is likely caused by CDR schedules, which are based on the likelihood of medical improvement. Beneficiaries for whom medical improvement is expected (MIE) account for roughly 5-10 percent of all reviews, which are scheduled anywhere from 6 to 24 months following the most recent disability decision. Roughly 10.5 percent of MIEs result in an *initial cessation* (i.e., those occurring before any appeal of decision) of benefits, causing the first peak in recoveries. Beneficiaries for whom medical improvement is possible but less likely to occur within the first 2 years (MIP) account for roughly 65-70 percent of reviews, which are scheduled every 36 months. Roughly 8.5 percent of MIPs result in an initial cessation of benefits, causing the second peak in recoveries. Beneficiaries for whom medical improvement is not expected (MINE) account for roughly 25-30 percent of reviews, which are scheduled every 5 to 7 years. Roughly 4.5 percent of MINEs result in an initial cessation of benefits.

As previously stated, the probability of death among males exceeds that for females for virtually all attained ages, as males experience nearly twice the incidence of high risk circulatory disorders and two-thirds more injuries. The probability of recovery among males also exceeds that for females in over 85 percent of all attained ages. Evidence suggests that this may be due to differences in the concentration of impairment catego-

ries among genders, especially at older ages. During the observation period, both sexes exhibit high prevalence of mental and musculoskeletal impairments. However the relative concentration of mental impairments among females is much greater—18 percent higher overall, and 25 percent higher among ages 50 or older. The nature of these types of impairments seems to contribute to both lower mortality and lower chance of recovery among female disabled workers.

Analysis of the 5-year period covered in this study shows a dramatic increase in the rate of disability recovery for virtually all male and female beneficiaries, when compared to the previous 5-year period (1991-95)¹⁴. For males, most ages exhibit a 50-100 percent increase in the probability of recovery, while females show increases ranging from 25-75 percent. A disproportionate amount of the improvement is attributable to the elimination of beneficiaries whose disability was based on drug or alcohol addiction, causing a one-time spike in recoveries in 1997. That year, the overall recovery rate among males more than doubled to 27 per thousand entitled versus 12 per thousand in the prior year. Females also experienced a surge to 16 per thousand versus 10 per thousand in the prior year.

As previously mentioned, exogenous variables can also influence recovery rates. During 1991-95, the DI program experienced significant growth in claims, which limited the number of CDRs performed over that period. This trend was reversed through enactment of Public Law 104-121 in 1996, which provided special funding for CDR activity, and contributed significantly to the large increase in recoveries over 1996-2000.

Tables 15A-15B show the number of lives for a series of cohorts—each for a given select age—reflecting the probabilities of recovery shown in tables 14A-14B. Note that in this case, the concept of “survival” refers to beneficiaries who remain on the DI rolls by *not recovering*.

Tables 16A-16B show the expected number of future years of disability entitlement for those who have not recovered and remain on the DI rolls. Values are based on the survivorship experience shown in tables 15A-15B, which reflect termination due to recovery only, and automatic conversion to old-age benefits upon attaining normal retirement age. As previously discussed, males tend to exhibit a greater chance of recovery than females. Analysis shows that, on average, females remain on the disability rolls roughly 6 months longer than males.

Tables 17A-17B show the *absolute rate of recovery* per thousand entitled disabled workers, which are derived from the probabilities of recovery shown in tables 14A-14B. See the appendix for details on the derivation of these rates.

¹⁴ Findings are based on comparisons with disability recovery as discussed in Actuarial Study No. 114: *Social Security Disability Insurance Program Worker Experience* (Zayatz, June 1999).

Tables 18 and 19 show the aggregate probability of recovery and expected time on the DI rolls, by *select* and *attained* age. Probabilities are based on aggregate counts of exposure and recoveries across all durations. They represent the average probability of recovery within one year for beneficiaries originally entitled at a particular select age (table 18), or who have attained a particular age (table 19). Similarly, expected time on the DI rolls represents the average number of future years of entitlement for those who remain on the rolls. These values are exposure-weighted averages of the values shown in tables 16A-16B, which reflect termination due to recovery only, and automatic conversion to old-age benefits upon attaining normal retirement age.

Table 20 shows the aggregate probability of recovery and expected time on the DI rolls, by *duration*. Probabilities are based on aggregate counts of exposure and recoveries across all select ages, and represent the average probability of recovery within the next year of entitlement to disability benefits. Expected time on the DI rolls represents the average number of future years of entitlement—reflecting termination due to recovery only—for those who have not recovered after the stated number of years.

F. Combined Experience (1996-2000)

Tables 21A-21B show the combined probability of death or recovery for male and female DI disabled workers, by select age and duration. Values are derived from death probabilities shown in tables 7A-7B and recovery probabilities shown in tables 14A-14B.

Tables 22A-22C show the number of lives for a series of cohorts, reflecting termination from DI entitlement due to death or recovery. The tables also reflect termination from OASI entitlement due to death, following conversion to old-age benefits.

Tables 23A-23B show the expected number of future years of combined DI and OASI entitlement for those originally entitled to disability benefits. Values are based on survivorship experience shown in tables 22A-22C, which reflect automatic conversion to old-age benefits upon attaining normal retirement age.

Tables 24A-24B show the expected number of future years of DI entitlement for those who have not died or recovered. Values are based on survivorship experience shown in tables 22A-22B. Entitlement is not considered after conversion to old-age benefits.

Tables 25 and 26 show the aggregate probability of death or recovery and expected time on the beneficiary rolls, by *select* and *attained* age. Values are derived from the average death and recovery probabilities discussed previously. They represent the average probability of total decrement within one year for beneficiaries originally entitled at a particular select age (table 25), or who have attained a particular age (table 26). Aggregate expected time on the OASDI rolls represents the average number of future years of combined entitlement for those originally entitled to disability benefits. These values are exposure-weighted averages of expected time on the combined rolls shown in tables 23A-23B, and reflect automatic conversion to old-age benefits upon attaining normal retirement age. Aggregate expected time on the DI rolls represents the average number of future years of disability entitlement. These values are exposure-weighted averages of expected time on the DI rolls shown in tables 24A-24B. Entitlement is not considered after conversion to old-age benefits.

Table 27 shows the aggregate probability of death or recovery and expected time on the beneficiary rolls, by *duration*. Values are derived from average death and recovery probabilities, and represent the average probability of total decrement within the next year of entitlement. Aggregate expected time on the OASDI rolls represents the average number of future years of combined entitlement for those originally entitled to disability benefits who have not died or recovered after the stated number of years. Aggregate expected time on the DI rolls represents the average number of future years of disability entitlement for those who have not died or recovered after the stated number of years.

G. Annuity Tables

Tables 28A-31D show the present value of a stream of payments to a disabled worker, by select age at entitlement. Annual or monthly payments are made at the beginning (*annuity-due*) or end (*annuity-immediate*) of each period. Receipt of payment is contingent upon survival to the next payment date. Note that “survival” denotes remaining entitled to benefits, which may imply *not recovering* as well as *not dying*. Payments are discounted using the stated annual effective interest rate and various survivorship assumptions. Tables 28A-29D show the actuarial present value of a *life annuity* of \$1 payable to a disabled worker. Values are based on survivorship experience shown in tables 8A-8C, which reflect termination due to death only, and automatic conversion to old-age benefits upon attaining normal retirement age. Tables 30A-31D show the actuarial present value of a life annuity of \$1 payable to a disabled worker until age 65. Values are based on survivorship experience shown in tables 22A-22B, which reflect termination due to death or recovery.

¹ Ranked by average percentage over the 5-year period 1998-2002.

² Includes listings for arthritis, amputation, back and bone disorders.

³ Includes listings for schizophrenia, paranoia, mental retardation, and personality disorders.

⁴ Includes listings for heart disease, hypertension, and aneurysm.

⁵ Includes listings for malignant growths.

⁶ Includes listings for epilepsy, Parkinson's disease, cerebral palsy, and multiple sclerosis.

⁷ Includes listings for asthma, tuberculosis, and cystic fibrosis.

⁸ Includes listings for diabetes and disorders of the thyroid, pituitary, and adrenal glands. Effective October 1999, the Listing of Impairments was changed to eliminate awards based solely on obesity.

⁹ Includes listings for impairments specifically related to HIV beginning in 1990.

¹⁰ Includes listings for congenital anomalies, and blood, digestive, genitourinary, and skin disorders; data for 1984-85 reflect a significant number of cases for which diagnosis was not available.

¹ Data for claims filed in 1993-2003 reflect results as of June 2004 (DDS level) or August 2004 (OHA level). The number of total claims filed for 2002-03 are subject to change. Data for claims filed in 2004 are preliminary estimates as of January 2005. The ultimate number of allowances and denials are subject to change until all initial decisions have been completed and all appeals are final.

² Includes cases appealed to the Office of Hearings and Appeals, as well as beyond OHA to the Federal courts.

³ Number of allowances as a percentage of decisions (allowances plus denials) at this level.

⁴ Cases appealed directly to OHA under Prototype Model—currently being tested in 10 States—which eliminates reconsideration step in disability determination process.

⁵ Number of appeals as a percentage of denials at this level. For years where decisions are still pending, the preliminary percentage shown could change substantially as all claims are processed.

⁶ Number of persons appealing beyond the reconsideration level.

⁷ Includes cases remanded to OHA from the Federal courts.

⁸ Number of allowances as a percentage of denials at this level. For years where decisions are still pending, the preliminary percentage shown will ultimately be lower as all cases are processed. This is true since allowances are generally processed more quickly than denials.

⁹ Includes denied claims where the final administrative action was a dismissal of an appeal request (for example, the appeal was not filed timely or the applicant failed to appear at the scheduled hearing).

Table 3.—Disabled Worker Benefits Awarded
(Grouped by age and year of award, 1980-2004 Social Security DI disability experience)

Source:

- (1) Age-specific and gross rates computed as the ratio of annual awards, to exposure of the disability insured population not receiving benefits.
- (2) Total adjusted rate by sex computed as the ratio of total age-adjusted awards, to total exposure of the disability insured population not receiving benefits as of calendar year 2000.
- (3) Total adjusted rate for male and female combined computed as the ratio of total age-sex-adjusted awards, to total combined exposure of the disability insured population not receiving benefits as of calendar year 2000.

Table 5.—Disabled Worker Benefits Terminated and Gross Termination Rates
(Grouped by reason for termination and year, 1980-2004 Social Security DI disability experience)

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
2. The value $q_{[x]+t}$ at duration t represents the probability of death—in a multiple-decrement environment—during the $(t+1)$ year of entitlement for those originally entitled to disability benefits at select age $[x]$ who have attained age $[x]+t$.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 7C** for attained ages beyond age 74.
4. Results have been graduated using the Whittaker-Henderson Type B two-dimensional method.

Notes:

1. The value at attained age x represents the probability of death within one year for those originally entitled to disability benefits who have attained that particular age.
2. Results have been blended based on attributes from general population mortality for calendar year 2000. Values are an extension of the ultimate column of **tables 7A** and **7B**.

Notes:
1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
2. The value $I_{[x]}$ at duration 0 represents the assumed number of lives originally entitled to disability benefits at select age $[x]$; the value $I_{[x]+t}$ at duration $t > 0$ represents the number of lives remaining from the original $I_{[x]}$ who have attained age $[x]+t$. Lives are decremented using probabilities from **table 7A**.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 8C** for attained ages beyond age 74.

Table 8B.—Female Disabled Workers
Survival Table

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
2. The value $l_{[x]}$ at duration 0 represents the assumed number of lives originally entitled to disability benefits at select age $[x]$; the value $l_{[x]+t}$ at duration $t > 0$ represents the number of lives remaining from the original $l_{[x]}$ who have attained age $[x]+t$. Lives are decremented using probabilities from **table 7B**.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 8C** for attained ages beyond age 74.

Table 8C.—Disabled Workers Age 75 and Older
Survival Table
(1996-2000 Social Security DI disability experience)

Attained age	Male	Female
75	19,356	31,203
76	17,528	29,213
77	15,780	27,277
78	14,118	25,329
79	12,543	23,412
80	11,054	21,548
81	9,667	19,679
82	8,386	17,876
83	7,189	16,073
84	6,070	14,347
85	5,086	12,699
86	4,201	11,098
87	3,433	9,597
88	2,774	8,206
89	2,215	6,921
90	1,746	5,746
91	1,358	4,712
92	1,041	3,813
93	786	3,042
94	584	2,390
95	426	1,847
96	305	1,402
97	214	1,044
98	147	761
99	99	543
100	65	378
101	41	256
102	25	169
103	15	108
104	9	67
105	5	40
106	3	23
107	2	12
108	1	6
109	0	3
110	—	1

Notes:

1. The value at attained age x represents the number of lives remaining from those originally entitled to disability benefits who have attained that particular age.
2. Lives are decremented using probabilities from **table 7C**. Values are an extension of the ultimate column of **tables 8A** and **8B**.

Table 9A.—Male Disabled Workers
Expected Future Lifetime
(1996-2000 Social Security DI disability experience)

Select age	Duration of disability											Attained age
	0	1	2	3	4	5	6	7	8	9	10 or more	
16	42.37	41.57	40.97	40.23	39.50	38.81	38.09	37.26	36.51	35.76	35.05	26

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
2. The value $e_{[x]+t}$ at duration t represents the average number of years of life remaining for those originally entitled to disability benefits at select age $[x]$ who have attained age $[x]+t$. Values are based on survivorship experience from **tables 8A** and **8C**.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 9C** for attained ages beyond age 74.

Table 9B.—Female Disabled Workers
Expected Future Lifetime
(1996-2000 Social Security DI disability experience)

Select age	Duration of disability											Attained age
	0	1	2	3	4	5	6	7	8	9	10 or more

64	11.48	12.20	12.18	11.95	11.60	11.24	10.89	10.57	10.22	9.84	9.55	74

Notes:
1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
2. The value $e_{[x]+t}$ at duration t represents the average number of years of life remaining for those originally entitled to disability benefits at select age $[x]$ who have attained age $[x]+t$. Values are based on survivorship experience from **tables 8B and 8C**.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 9C** for attained ages beyond age 74.

Table 9C.—Disabled Workers Age 75 and Older
Expected Future Lifetime
(1996-2000 Social Security DI disability experience)

Attained age	Male	Female
75	7.06	9.14
76	6.74	8.73
77	6.43	8.31
78	6.13	7.92
79	5.84	7.52
80	5.56	7.13
81	5.28	6.76
82	5.01	6.39
83	4.76	6.05
84	4.55	5.72
85	4.33	5.40
86	4.14	5.10
87	3.95	4.82
88	3.78	4.56
89	3.60	4.31
90	3.44	4.09
91	3.27	3.88
92	3.12	3.67
93	2.97	3.48
94	2.82	3.29
95	2.69	3.11
96	2.55	2.93
97	2.43	2.77
98	2.30	2.61
99	2.18	2.46
100	2.05	2.31
101	1.96	2.18
102	1.90	2.04
103	1.83	1.91
104	1.72	1.77
105	1.70	1.63
106	1.50	1.46
107	1.00	1.33
108	0.50	1.17
109	0.00	0.83
110	—	0.50

Notes:

1. The value at attained age x represents the average number of years of life remaining for those originally entitled to disability benefits who have attained that particular age.
2. Expected lifetimes are based on survivorship experience from **table 8C**. Values are an extension of the ultimate column of **tables 9A** and **9B**.

- Notes:
1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
 2. The value $q_{[x]+t}$ at duration t represents the number of deaths per thousand during the $(t+1)$ year of entitlement for those originally entitled to disability benefits at select age $[x]$ who have attained age $[x]+t$. Rates are derived from death probabilities shown in **table 7A** and recovery probabilities shown in **table 14A**. See appendix for details.
 3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 10C** for attained ages beyond age 74.

Table 10B.—Female Disabled Workers
Absolute Death Rate Per Thousand Entitled
(1996-2000 Social Security DI disability experience)

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
2. The value $q_{[x]+t}$ at duration t represents the number of deaths per thousand during the $(t+1)$ year of entitlement for those originally entitled to disability benefits at select age $[x]$ who have attained age $[x]+t$. Rates are derived from death probabilities shown in **table 7B** and recovery probabilities shown in **table 14B**. See appendix for details.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 10C** for attained ages beyond age 74.

Table 10C.—Disabled Workers Age 75 and Older
Absolute Death Rate Per Thousand Entitled
(1996-2000 Social Security DI disability experience)

Attained age	Male	Female
75	94.433	63.774
76	99.709	66.266
77	105.330	71.415
78	111.571	75.675
79	118.693	79.616
80	125.443	86.738
81	132.482	91.633
82	142.786	100.881
83	155.626	107.363

93	257.166	214.425
94	270.024	227.290
95	283.525	240.927
96	297.702	255.383
97	312.587	270.706
98	328.216	286.948
99	344.627	304.165
100	361.858	322.415
101	379.951	341.760
102	398.949	362.266
103	418.896	384.002
104	439.841	407.042
105	461.833	431.464
106	484.924	457.352
107	509.171	484.793
108	534.629	513.881
109	561.361	544.714
110	589.429	577.397

Notes:

1. The value at attained age x represents the number of deaths per thousand within one year for those originally entitled to disability benefits who have attained that particular age.
2. Absolute rates are derived from death probabilities shown in **table 7C**. Values are an extension of the ultimate column of **tables 10A** and **10B**.

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits.
2. *Probability of death* at select age [x] represents the average probability of death within one year for those originally entitled to disability benefits at that particular age. Values are based on aggregate counts of exposure and deaths across all durations, and have been graduated using Whittaker-Henderson method.
3. *Future lifetime* at select age [x] represents the aggregate life expectancy in years for those originally entitled to disability benefits at that particular age. Values are exposure-weighted averages of expected future lifetime across all durations from **tables 9A, 9B and 9C**.

Table 12.—Disabled Workers
Aggregate Probability of Death and Expected Future Lifetime,
by Attained Age

74	0.090031	7.38	0.061155	9.55

Notes:

1. *Attained age* calculated as sum of select age and duration.
2. *Probability of death* at attained age x represents the average probability of death within one year for those originally entitled to disability benefits who have attained that particular age. Values are based on aggregate counts of exposure and deaths across all durations, and have been graduated using Whittaker-Henderson method. See **table 7C** for attained ages beyond age 74.
3. *Future lifetime* at attained age x represents the aggregate life expectancy in years for those originally entitled to disability benefits who have attained that particular age. Values are exposure-weighted averages of expected future lifetime across all durations from **tables 9A** and **9B**. See **table 9C** for attained ages beyond age 74.

Notes:

1. *Duration* measured in years since selection.

2. *Probability of death* at duration *t* represents the average probability of death during the (*t*+1) year of entitlement to benefits. Values are based on aggregate counts of exposure and deaths across all select ages. Results have been graduated using Whittaker-Henderson method, and blended to reflect mortality trends established in **table 7C**.

3. *Future lifetime* at duration *t* represents the aggregate life expectancy in years for those originally entitled to disability benefits who have not died after *t* years. Values are exposure-weighted averages of expected future lifetime across all ages from **tables 9A, 9B and 9C**.

**Recovery Experience
by Select Age and Duration
(1996-2000)**

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program. Recovery is not considered beyond normal retirement age.
2. The value $q_{[x]+t}$ at duration t represents the probability of recovery while on the DI rolls—in a multiple-decrement environment—during the $(t+1)$ year of entitlement for those originally entitled to disability benefits at select age $[x]$ who have attained age $[x]+t$.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection.
4. Results have been graduated using the Whittaker-Henderson Type B two-dimensional method.

- Notes:
1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program. Recovery is not considered beyond normal retirement age.
 2. The value $q_{[x]+t}$ at duration t represents the probability of recovery while on the DI rolls—in a multiple-decrement environment—during the $(t+1)$ year of entitlement for those originally entitled to disability benefits at select age $[x]$ who have attained age $[x]+t$.
 3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection.
 4. Results have been graduated using the Whittaker-Henderson Type B two-dimensional method.

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program. Recovery is not considered beyond normal retirement age.
2. The value $l_{[x]}$ at duration 0 represents the assumed number of lives originally entitled to disability benefits at select age $[x]$; the value $l_{[x]+t}$ at duration $t > 0$ represents the number of lives from the original $l_{[x]}$ who have not recovered and remain on the DI rolls as of attained age $[x]+t$. Lives are decremented using probabilities from **table 14A**.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection.

Notes:
1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program. Recovery is not considered beyond normal retirement age.
2. The value $l_{[x]}$ at duration 0 represents the assumed number of lives originally entitled to disability benefits at select age $[x]$; the value $l_{[x]+t}$ at duration $t > 0$ represents the number of lives from the original $l_{[x]}$ who have not recovered and remain on the DI rolls as of attained age $[x]+t$. Lives are decremented using probabilities from **table 14B**.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection.

Table 16A.—Male Disabled Workers
Expected Time on the DI Rolls (Recovery Termination Only)
(1996-2000 Social Security DI disability experience)

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program. Recovery is not considered beyond normal retirement age.
2. The value $e_{[x]+t}$ at duration t represents the expected number of future years of DI entitlement for those originally entitled to benefits at select age $[x]$ who have not recovered as of attained age $[x]+t$. Values are based on survivorship experience from **table 15A**, which reflects termination due to recovery only.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection.

Notes:
1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program. Recovery is not considered beyond normal retirement age.
2. The value $e_{[x]+t}$ at duration t represents the expected number of future years of DI entitlement for those originally entitled to benefits at select age $[x]$ who have not recovered as of attained age $[x]+t$. Values are based on survivorship experience from **table 15B**, which reflects termination due to recovery only.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection.

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program. Recovery is not considered beyond normal retirement age.
2. The value $q_{[x]+t}^t$ at duration t represents the number of recoveries per thousand during the $(t+1)$ year of entitlement for those originally entitled to disability benefits at select age $[x]$ who have attained age $[x]+t$. Rates are derived from death probabilities shown in **table 7A** and recovery probabilities shown in **table 14A**. See appendix for details.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection.

- Notes:
1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program. Recovery is not considered beyond normal retirement age.
 2. The value $q_{[x]+t}^t$ at duration t represents the number of recoveries per thousand during the $(t+1)$ year of entitlement for those originally entitled to disability benefits at select age $[x]$ who have attained age $[x]+t$. Rates are derived from death probabilities shown in **table 7B** and recovery probabilities shown in **table 14B**. See appendix for details.
 3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection.

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits.
2. *Probability of recovery* at select age [x] represents the average probability of recovery within one year for those originally entitled to disability benefits at that particular age. Values are based on aggregate counts of exposure and recoveries across all durations, and have been graduated using Whittaker-Henderson method.
3. *Time on DI rolls* at select age [x] represents the average number of future years of DI entitlement for those originally entitled to benefits at that particular age who have not recovered. Values are exposure-weighted averages of expected time on the DI rolls across all durations from **tables 16A** and **16B**, which reflect termination due to recovery only. Entitlement is not considered after conversion to old-age benefits.

¹ Negligible probability of recovery.

Notes:

1. *Duration* measured in years since selection.
2. *Probability of recovery* at duration *t* represents the average probability of recovery during the (*t*+1) year of entitlement to benefits. Values are based on aggregate counts of exposure and recoveries across all select ages. Results have been graduated using Whittaker-Henderson method.
3. *Time on DI rolls* at duration *t* represents the average number of future years of DI entitlement for those who have not recovered after *t* years. Values are exposure-weighted averages of expected time on the DI rolls across all ages from **tables 16A** and **16B**, which reflect termination due to recovery only. Entitlement is not considered after conversion to old-age benefits.

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
2. The value $q_{[x]+t}$ at duration t represents the probability of death or recovery from disability during the $(t+1)$ year of entitlement for those originally entitled to benefits at select age $[x]$ who have attained age $[x]+t$. Values are derived from death probabilities shown in **table 7A** and recovery probabilities shown in **table 14A**.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 7C** for death probabilities beyond attained age 74.

Table 21B.—Female Disabled Workers
Probability of Death or Recovery
(1996-2000 Social Security DI disability experience)

Select age	Duration of disability										10 or more	Attained age

- Notes:
1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
 2. The value $q_{[x]+t}$ at duration t represents the probability of death or recovery from disability during the $(t+1)$ year of entitlement for those originally entitled to benefits at select age $[x]$ who have attained age $[x]+t$. Values are derived from death probabilities shown in **table 7B** and recovery probabilities shown in **table 14B**.
 3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 7C** for death probabilities beyond attained age 74.

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
2. The value $l_{[x]}$ at duration 0 represents the assumed number of lives originally entitled to disability benefits at select age $[x]$; the value $l_{[x]+t}$ at duration $t > 0$ represents the number of lives remaining from the original $l_{[x]}$ who have attained age $[x]+t$. Lives are decremented using probabilities from **table 21A**.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 22C** for attained ages beyond age 74.

Notes:
1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
2. The value $I_{[x]}$ at duration 0 represents the assumed number of lives originally entitled to disability benefits at select age $[x]$; the value $I_{[x]+t}$ at duration $t > 0$ represents the number of lives remaining from the original $I_{[x]}$ who have attained age $[x]+t$. Lives are decremented using probabilities from **table 21B**.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 22C** for attained ages beyond age 74.

Table 22C.—Disabled Workers Age 75 and Older
Survival Table
(1996-2000 Social Security DI disability experience)

Attained age	Male	Female
75	5,581	10,656
76	5,054	9,976
77	4,550	9,315
78	4,071	8,650

105	1	13
106	1	7
107	1	4
108	0	2
109	—	1
110	—	0

Notes:

1. The value at attained age x represents the number of lives remaining from those originally entitled to disability benefits who have attained that particular age.
2. Lives are decremented using probabilities from **table 7C**. Values are an extension of the ultimate column of **tables 21A** and **21B**.

Table 23A.—Male Disabled Workers
Expected Time on the OASDI Rolls
(1996-2000 Social Security DI disability experience)

Select age	Duration of disability											Attained age
	0	1	2	3	4	5	6	7	8	9	10 or more

Notes:
1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
2. The value $e_{[x]+t}$ at duration t represents the expected number of future years of combined DI and OASI entitlement for those originally entitled to disability benefits at select age $[x]$ who have not died or recovered as of attained age $[x]+t$. Values are based on survivorship experience from **tables 22A** and **22C**, and reflect automatic conversion to old-age benefits upon attaining normal retirement age.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection. See **table 9C** for expected future lifetimes beyond attained age 74.

Table 23B.—Female Disabled Workers
Expected Time on the OASDI Rolls
(1996-2000 Social Security DI disability experience)

Select age	Duration of disability											Attained age

- Notes:
1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
 2. The value $e_{[x]+t}$ at duration t represents the expected number of future years of DI entitlement for those originally entitled to benefits at select age $[x]$ who have not died or recovered as of attained age $[x]+t$. Values are based on survivorship experience from **table 22A**. Entitlement is not considered after conversion to old-age benefits.
 3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection.

Table 24B.—Female Disabled Workers
Expected Time on the DI Rolls
(1996-2000 Social Security DI disability experience)

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits. *Duration* measured in years since selection. *Attained age* calculated as sum of select age and duration. Results do not include auxiliary beneficiaries payable under the DI program.
2. The value $e_{[x]+t}$ at duration t represents the expected number of future years of DI entitlement for those originally entitled to benefits at select age $[x]$ who have not died or recovered as of attained age $[x]+t$. Values are based on survivorship experience from **table 22B**. Entitlement is not considered after conversion to old-age benefits.
3. Select-and-ultimate table is read across the row for 0-10 years since selection, and down the last (ultimate) column for 10 or more years since selection.

Table 25.—Disabled Workers
Aggregate Probability of Death or Recovery and Expected Time on the Rolls,
by Select Age

(1996-2000 Social Security DI disability experience)

Notes:

1. *Select age* denotes age last birthday at entitlement to disability benefits.
2. *Probability of death or recovery* at select age [x] represents the average probability of total decrement within one year for those originally entitled to disability benefits at that particular age. Values are derived from the average death probabilities shown in **table 11** and the average recovery probabilities shown in **table 18**.
3. *Time on OASDI rolls* at select age [x] represents the average number of future years of combined DI and OASI entitlement for those originally entitled to disability benefits at that particular age. Values are exposure-weighted averages of expected time on the combined rolls across all durations from **tables 23A, 23B** and **9C**, and reflect automatic conversion to old-age benefits upon attaining normal retirement age.
4. *Time on DI rolls* at select age [x] represents the average number of future years of DI entitlement for those originally entitled to benefits at that particular age. Values are exposure-weighted averages of expected time on the DI rolls across all durations from **tables 24A** and **24B**. Entitlement is not considered after conversion to old-age benefits.

Notes:

1. *Attained age* calculated as sum of select age and duration.
2. *Probability of death or recovery* at attained age *x* represents the average probability of total decrement within one year for those originally entitled to disability benefits who have attained that particular age. Values are derived from the average death probabilities shown in **table 12** and the average recovery probabilities shown in **table 19**. See **table 7C** for death probabilities beyond attained age 74.
3. *Time on OASDI rolls* at attained age *x* represents the average number of future years of combined DI and OASI entitlement for those originally entitled to disability benefits who have attained that particular age. Values are exposure-weighted averages of expected time on the combined rolls across all durations from **tables 23A** and **23B**, and reflect automatic conversion to old-age benefits upon attaining normal retirement age. See **table 9C** for expected future lifetimes beyond attained age 74.
4. *Time on DI rolls* at attained age *x* represents the average number of future years of DI entitlement for those originally entitled to benefits who have attained that particular age. Values are exposure-weighted averages of expected time on the DI rolls across all durations from **tables 24A** and **24B**. Entitlement is not considered after conversion to old-age benefits.

Table 27.—Disabled Workers
Aggregate Probability of Death or Recovery and Expected Time on the Rolls,
by Duration

(1996-2000 Social Security DI disability experience)

Notes:

1. *Duration* measured in years since selection.

2. *Probability of death or recovery* at duration *t* represents the average probability of total decrement during the (*t*+1) year of entitlement to benefits. Values are derived from the average death probabilities shown in **table 13** and the average recovery probabilities shown in **table 20**.

3. *Time on OASDI rolls* at duration *t* represents the average number of future years of combined DI and OASI entitlement for those originally entitled to disability benefits who have not died or recovered after *t* years. Values are exposure-weighted averages of expected time on the combined rolls across all ages from **tables 23A, 23B** and **9C**, and reflect automatic conversion to old-age benefits upon attaining normal retirement age.

4. *Time on DI rolls* at duration *t* represents the average number of future years of DI entitlement for those originally entitled to benefits who have not died or recovered after *t* years. Values are exposure-weighted averages of expected time on the DI rolls across all ages from **tables 24A** and **24B**. Entitlement is not considered after conversion to old-age benefits.

¹Present value of annual payments of \$1 payable at the beginning of each year, starting with the year of entitlement and continuing thereafter for the life of the annuitant. Receipt of payment is contingent upon survival to the next payment date. Payments are discounted to the beginning of entitlement using the stated annual effective interest rate, and survivorship experience shown in tables 8A and 8C.

¹Present value of monthly payments of \$1 payable at the beginning of each month, starting with the year of entitlement and continuing thereafter for the life of the annuitant. Receipt of payment is contingent upon survival to the next payment date. Payments are discounted to the beginning of entitlement using the stated annual effective interest rate, and survivorship experience shown in tables 8A and 8C.

¹Present value of monthly payments of \$1 payable at the end of each month, starting with the year of entitlement and continuing thereafter for the life of the annuitant. Receipt of payment is contingent upon survival to the next payment date. Payments are discounted to the beginning of entitlement using the stated annual effective interest rate, and survivorship experience shown in tables 8A and 8C.

¹Present value of annual payments of \$1 payable at the beginning of each year, starting with the year of entitlement and continuing thereafter for the life of the annuitant. Receipt of payment is contingent upon survival to the next payment date. Payments are discounted to the beginning of entitlement using the stated annual effective interest rate, and survivorship experience shown in tables 8B and 8C.

¹ Present value of annual payments of \$1 payable at the end of each year, starting with the year of entitlement and continuing thereafter for the life of the annuitant. Receipt of payment is contingent upon survival to the next payment date. Payments are discounted to the beginning of entitlement using the stated annual effective interest rate, and survivorship experience shown in tables 8B and 8C.

¹Present value of monthly payments of \$1 payable at the beginning of each month, starting with the year of entitlement and continuing thereafter for the life of the annuitant. Receipt of payment is contingent upon survival to the next payment date. Payments are discounted to the beginning of the experience using the stated annual effective interest rate, and survivorship experience shown in tables 8B and 8C.

¹Present value of monthly payments of \$1 payable at the end of each month, starting with the year of entitlement and continuing thereafter for the life of the annuitant. Receipt of payment is contingent upon survival to the next payment date. Payments are discounted to the beginning of entitlement using the stated annual effective interest rate, and survivorship experience shown in tables 8B and 8C.

¹Present value of annual payments of \$1 payable at the end of each year, starting with the year of entitlement and continuing up to age 65. Receipt of payment is contingent upon survival under all forms of decrement to the next payment date. Payments are discounted to the beginning of entitlement using the stated annual effective interest rate, and survivorship experience shown in table 22A.

¹Present value of monthly payments of \$1 payable at the beginning of each month, starting with the year of entitlement and continuing up to age 65. Receipt of payment is contingent upon survival under all forms of decrement to the next payment date. Payments are discounted to the beginning of entitlement using the stated annual effective interest rate, and survivorship experience shown in table 22A.

**Table 30D.—Male Disabled Workers
Monthly Life Annuity to Age 65 (Immediate)¹**
(1996–2000 Social Security DI disability experience)

¹Present value of monthly payments of \$1 payable at the end of each month, starting with the year of entitlement and continuing up to age 65. Receipt of payment is contingent upon survival under all forms of decrement to the next payment date. Payments are discounted to the beginning of entitlement using the stated annual effective interest rate, and survivorship experience shown in table 22A.

¹Present value of annual payments of \$1 payable at the beginning of each year, starting with the year of entitlement and continuing up to age 65. Receipt of payment is contingent upon survival under all forms of decrement to the next payment date. Payments are discounted to the beginning of entitlement using the stated annual effective interest rate, and survivorship experience shown in table 22B.

¹Present value of monthly payments of \$1 payable at the beginning of each month, starting with the year of entitlement and continuing up to age 65. Receipt of payment is contingent upon survival under all forms of decrement to the next payment date. Payments are discounted to the beginning of entitlement with the stated annual effective interest rate, and survivorship experience shown in table 22B.

¹Present value of monthly payments of \$1 payable at the end of each month, starting with the year of entitlement and continuing up to age 65. Receipt of payment is contingent upon survival under all forms of decrement to the next payment date. Payments are discounted to the beginning of entitlement using the stated annual effective interest rate, and survivorship experience shown in table 22B.

APPENDIX

V. STUDY POPULATION AND METHODS

A. Overview

For this study, we analyzed over 9.9 million records of Social Security Disability Insurance (DI) worker beneficiaries from the 5-year period January 1, 1996 through December 31, 2000. Data are based on a 100 percent sample from the Social Security Administration Master Beneficiary Record (MBR). The primary variables of interest include: the reason for decrement from the disability rolls, and duration since entitlement. However, factors other than time since selection affect survival. These include the standard concomitant variables of select age and sex of the beneficiary. The analysis reflects a total of roughly 21.9 million life-years of exposure for males and 15.6 million life-years of exposure for females. A 10-year select period was chosen for this study, implying that decrement for participants 10 or more years beyond selection is no longer a function of select age, but a function of attained age only.

Termination of DI benefits can occur for the following reasons:

- Death of the beneficiary;
- Recovery—includes medical recovery or return to work;
- Converting to old-age benefits; and
- All other reasons.

Terminations due to “all other reasons” are treated as withdrawal from the study, and directly affect exposure. However, separate decrement tables are not developed for categories other than death and recovery. The table below provides a count of the number of deaths and recoveries collected from the MBR. Note that there exist differences in classifying various disability actions among the various data sources consulted for this study. Further note that to a certain extent, this study also covers the activity of the OASI rolls, but only as it relates to tracking disabled beneficiaries who have voluntarily switched to OASI benefits prior to normal retirement age, or have automatically been converted to the OASI rolls upon attaining normal retirement age. As a result, termination counts stated here will differ from those stated elsewhere—the number of deaths will be dramatically different as they include substantial counts from the OASI rolls.

Number of Disabled Worker Terminations, by Reason
(January 1996-December 2000)

Reason	Male	Female	Total
Death	1,106,045	577,988	1,684,033
Recovery	176,760	101,080	277,840
Total	1,282,805	679,068	1,961,873

Source: MBR database as of March 2004. Results do not include old-age conversions or terminations due to other reasons.

B. Data Considerations

The mortality experience is affected by several unique circumstances. It is recognized that a claimant may die during the 5-month waiting period required under the DI program—and therefore never becomes entitled; or the claimant may die before final disposition of the disability claim—in which case only retroactive disability benefits may be payable. With regard to the DI program, participation in this study is contingent upon entitlement to benefits. Therefore, death *prior to* entitlement is not a “countable” death. As a result, the probability of death during the first year of entitlement may be artificially lower than expected.

As it relates to this study, observation ends with the termination of benefits. Under the DI program, disabled workers may convert to old-age benefits at anytime beginning with age 62, with mandatory conversion taking place at normal retirement age. Such conversion is considered a termination of disability benefits as old-age benefits become payable from the OASI Trust Fund. However, disabled beneficiaries continue under observation in this study beyond the time of the switch. Consequently, deaths for attained ages 62 and older may come from the OASI rolls. Note that this is a material change from methods used in the previous DI Worker Experience study (Actuarial Study No. 114), which terminated observation with the last month in which DI benefits are payable. This enhancement allows tracking disabled lives into retirement, and further eliminates much of the “guesswork” involved in applying the cumbersome blending techniques used in that study for older attained ages. Hopefully the result is more robust estimates of mortality.

Mention was made earlier of a special disability workload of SSI recipients who are potentially eligible for DI benefits due to previously unrecognized disability-insured status. This workload has caused a supplemental increase in awards beginning in 2001. In most instances, entitlement is retroactive to well before the date of final review. However, due to the guidelines established for processing the workload, the cases involved at the time of completion of this study represent a biased sample of records. Consequently, these cases have been eliminated from the overall sample.

C. Data Collection

The model for this study utilizes a customized database that is constructed from 100 percent MBR data as of March 2004. The general record selection criteria are outlined below. The final data was subjected to numerous screenings and categorizations. Included in the study are:

- Primary claimants (workers) entitled to disability benefits sometime during the observation period;

- Primary claimants entitled to old-age benefits sometime during the observation period, who either voluntarily switched from the DI rolls to the OASI rolls prior to normal retirement age, or were automatically converted upon attaining normal retirement age;
- A maximum of three periods of disability for each primary having multiple periods of disability.

Excluded from the study are:

- Dependents (spouses and children) of a primary claimant;
- Primary claimants whose period of disability was terminated or permanently suspended prior to January 1, 1996; or whose entitlement period begins after December 31, 2000;
- Periods of entitlement to old-age benefits that were preceded by a period of disability which ended prior to OASI entitlement.

D. Methods

The availability of complete data on each participant in the study (including date of birth, date of entitlement, and cause of decrement) allows for direct estimation of the *multiple-decrement probabilities* $q^{(i)}$, where i represents the cause of decrement. The ordered pair (r, s) is determined for each age interval $(x, x + 1]$ for which a participant is under observation. The concept is that each participant enters the interval at age $x + r$ ($0 \leq r < 1$), and is scheduled to exit the interval at age $x + s$ ($0 < s \leq 1$). Numerically, $s - r$ is the amount of time (measured in life-years) that the participant is exposed to the risk of decrement. Summing over all participants, we can calculate the *scheduled exposure* contributed to an interval.¹⁵

A participant may survive to the end of an interval, or may exit the study prior to the end of the interval in the event of:

- Death;
- Recovery or other non-death decrement;
- The end of the observation period—termed an *observed ender*.

Based on these criteria, a *scheduled ending age*, $x + s$, is established for an age interval in which the participant is expected to either survive to the end ($s = 1$), or become an observed ender ($s < 1$).¹⁶ Scheduled exposure is then credited to the appropriate interval (or *duration* since selection) using the following conditions: if the participant survives to the end of the interval, then exposure is credited from $x + r$ to $x + 1$; if the participant

dies or is an observed ender within the interval, then exposure is credited from $x + r$ to $x + s$; if the participant withdraws from the study during the interval (for example, recovers), then exposure is credited from age $x + r$ to $x + s$. Note that since recovery from disability is no longer considered after converting to old-age benefits, a slight modification to this method is needed in crediting exposure for use in calculating recovery probabilities. As before, scheduled exposure is credited to durations entirely within a period of DI entitlement, however, *exact exposure* is credited only up until time of the switch to old-age benefits; no exposure is credited for durations entirely within a period of OASI entitlement.

Multiple-decrement probabilities are found by dividing the observed number of deaths or recoveries in an interval by the aggregate scheduled exposure for that interval. As discussed later, *single-decrement (absolute) rates* are derived from the probabilities using a constant force assumption for the distribution of decrement within a given interval.¹⁷

E. Select Age and Exposure

Entitlement to disability benefits usually occurs at some fractional age of the beneficiary. To facilitate exposure calculations, the *insuring age* of the participant and corresponding *insuring date of birth* are substituted for the actual age at entitlement and actual date of birth. In this study, the insuring age is calculated to be the beneficiary's *age last birthday* as of entitlement. For example, consider the following beneficiary data:

Date of entitlement: 1-February-2000
Date of birth: 10-July-1960
Actual age at entitlement: 39 years, 206 days
Insuring age: 39 years
Insuring date of birth: 1-February-1961

Use of insuring age results in an integral *select age* at entitlement ensuring that subsequent durations begin on the entitlement anniversary. This is true whether the participant enters the study during the observation period, or is already part of the entitlement group when the observation period opens.

For selection during the observation period, the *entry age (YI)* into the study is the beneficiary's age as of the date of entitlement. For selection prior to the beginning of the observation period, the entry age is the beneficiary's age as of January 1, 1996. In either case, the beneficiary's age is measured from the insuring date of birth.

¹⁵For a complete discussion, refer to chapter 6 of *Survival Models and Their Estimation* (London 1988, second edition).

¹⁶A participant who dies during the interval does so at age $x + t \leq x + s$; a participant observed to withdraw from the study during the interval also does so at age less than $x + s$.

¹⁷For a complete discussion on multiple-decrement probabilities, the associated single-decrement rates, and construction of the select-and-ultimate multiple-decrement tables found in this study, the reader is referred to chapter 10 of *Actuarial Mathematics* (Bowers et al. 1997).

The *scheduled exit age (ZI)* is the age at which the participant is scheduled to exit the study as an observed ender on December 31, 2000. The *actual exit age at death (THI)* or *withdrawal (PSI)* is the exact age at which the participant exits the study under those particular decrements.

The fractional-time variables used to determine scheduled exposure contributions for an observation interval are defined below:

- Time r at which observation begins:

$$r = \begin{cases} 0, & YI \leq x \\ YI - x, & x < YI < x + 1 \end{cases}$$

- Time s at which observation is scheduled to end:

$$s = \begin{cases} ZI - x, & x < ZI < x + 1 \\ 1, & ZI \geq x + 1 \end{cases}$$

The amount of exposure contributed at each duration is summarized as follows:

$$\text{exposure} = \begin{cases} s - r, & \text{survivor or ender} \\ s - r, & \text{death} \\ s - r, & \text{withdrawal (recovery, except as noted below)} \end{cases}$$

As previously mentioned, exact exposure is used in calculating recovery probabilities. This type of exposure is only credited to the interval during which conversion to old-age benefits takes place. Using a fractional-time variable, exact exposure is defined as $k - r$, where k is determined as follows:

$$k = \begin{cases} PSI - x, & \text{switch to OASI during interval} \\ \text{undefined,} & \text{otherwise} \end{cases}$$

Note that in this context PSI represents the exact age at the time of switch to old-age benefits.

F. Duration and Graduation

The intervals for which a participant is under observation—measured in years since selection—are called *durations*. For each select age $[x]$ and duration n , the ordered pair (r, s) represents the amount of exposure contributed to the observation interval $([x] + n, [x] + n + 1]$. For durations extending beyond the 10-year select period, exposure is credited to the appropriate attained age interval.

The select-and-ultimate multiple-decrement probabilities are graduated using the two-dimensional Whittaker-Henderson Type B method¹⁸. The horizontal and vertical smoothing coefficients were chosen to obtain some degree of smoothness within individual durations (columns) as well as within select ages (rows), while deviating as little as possible from the original estimates.

G. Survival Tables

Survival tables 8A-8C are constructed from select-and-ultimate death probabilities. The functions $l_{[x]}, l_{[x]+1}, \dots, l_{110}$ are first calculated for select age $[x] = 16$, using a radix of 100,000. This step determines values for the ultimate period of the table and older attained ages. Functions for select ages $[x] > 16$ are then derived retrospectively from the ultimate values. For example, $l_{[x]}$ is determined from l_{x+10} using the survival probabilities of the select period for the given select age. The number $l_{[x]+t}$ represents the number alive at the beginning of duration t from those originally entitled at select age $[x]$. Note that the number alive at various select ages are not actual counts of disability beneficiaries. Rather, the number living at the beginning of any duration are for illustrative purposes, chosen to represent the probability of survival based on values shown in tables 7A-7C.

Survival tables 15A-15B are similarly constructed from select-and-ultimate recovery probabilities shown in tables 14A-14B. Since recovery is no longer considered after attaining normal retirement age, these tables are truncated after attained age 64. Note that in this case, “survival” refers to beneficiaries who remain on the DI rolls by *not recovering*.

The survival tables are read across the row, or *select period*, for 0-10 years since selection, then down the last column, or *ultimate period* for 10 or more years since selection. Numbers for the following example can be found in table 8A. Of the male beneficiaries disabled at select age 30, the following table shows the number surviving (that is, still on the disability rolls) after the stated number of years:

Years since entitlement	Number living	Probability of survival	Attained age
0	102,707	1.000	30
1	97,906	.953	31
5	88,303	.860	35
10	82,019	.799	40
15	76,543	.745	45

¹⁸For details, refer to chapter 8 of *Graduation: The Revision of Estimates* (London 1985).

H. Expected Future Lifetime

Future lifetime tables are produced from the survival functions described above using basic actuarial principles found in any standard actuarial text on life contingencies. Also presented in this study are the results of aggregating over duration, by select age (see tables 11, 18, and 25) or attained age (see tables 12, 19, and 26).

Aggregate lifetime for a specific *select* age is an exposure-weighted average of the expected future lifetime at each duration of that age. This differs from aggregate lifetime for a specific *attained* age, which is an exposure-weighted average of the expected future lifetime of those durations representing a particular attained age.

For example, aggregate lifetime for *select* age 40 is a weighted average of the expected lifetimes shown for each duration 0 through 34—where each duration represents a different attained age. In contrast, aggregate lifetime for *attained* age 40 is the average of the expected lifetimes for a select 40-year-old at duration 0, select 39-year-old at duration 1,... select 20-year-old at duration 20—all of whom are attained age 40.

I. Probabilities and Absolute Rates

The data for this study were collected in a multiple-decrement environment, however, we present results for only two major decrements—death and recovery. The symbol $q^{(d)}$ represents the probability of death in the presence of the other decrements. Mathematically, this is represented by:

$$q_x^{(d)} = \int_0^1 {}_t p_x^{(\tau)} \mu_{x+t}^{(d)} dt$$

where $p^{(\tau)}$ is the probability of surviving under all decrements; and $\mu^{(d)}$ is the force of mortality.

For each of the causes of decrement in a multiple-decrement model, it is possible to define a single-decrement model that depends only on a particular cause of decrement. The symbol $q'^{(d)}$ represents the *single-decrement (absolute) rate* of death. Mathematically, this is represented by:

$$q_x'^{(d)} = \int_0^1 {}_t p_x'^{(d)} \mu_{x+t}^{(d)} dt$$

where $p'^{(d)}$ is the probability of *not dying*. In this representation, observation stops at the point of non-death decrement, and scheduled exposure is replaced by the smaller quantity of exact exposure. The result is lower exposure totals relative to those used in formulating death probabilities.

For each combination of select age and duration, the multiple-decrement probabilities $q^{(d)}$ and $q^{(r)}$ are calculated by dividing the observed number of deaths or recoveries by the exposure for that cell. These probabilities are used to derive the absolute rates of decrement $q'^{(d)}$ and $q'^{(r)}$ as shown below (note that d , r , and τ superscripts refer to death, recovery, and total decrement, respectively):

Derive the total decrement probability:

$$q^{(\tau)} = q^{(d)} + q^{(r)}$$

Under the assumption of constant force for each decrement over the age interval $(x, x + 1)$, absolute rates may be derived using the following:

$$q'^{(d)} = 1 - [1 - q^{(\tau)}]^{q^{(d)}/q^{(\tau)}}$$

$$q'^{(r)} = 1 - [1 - q^{(\tau)}]^{q^{(r)}/q^{(\tau)}}$$

In this study, absolute rates are presented on a “per thousand” basis.
