

UNISEX LIFE EXPECTANCY AT BIRTH AND AGE 65

by K. Mark Bye, ASA; Kent Morgan, FSA; and Michael Morris, ASA

Life expectancy at birth and life expectancy at age 65 are shown in tables V.A4 and V.A5 of the 2025 Trustees Report (officially called “The 2025 Annual Report of the Board of Trustees of the Federal Old-Age and Survivors Insurance and Federal Disability Insurance Trust Funds,” available at <http://www.ssa.gov/OACT/TR/2025/index.html>). The life expectancy values shown in those tables are presented on both a period and a cohort basis, separately, showing male life expectancy and female life expectancy. This note provides the corresponding unisex life expectancy, and a brief explanation of the calculation method.

The following standard actuarial functions¹ are used in developing life expectancy:

e_x = the average number of years of life remaining at exact age x

l_x = the number of persons surviving to exact age x

l_0 = the radix² (the starting number of persons in the life table at age 0)

For the purpose of this note, we add a second subscript to denote sex where the letters u , m , and f represent unisex, male, and female, respectively.

The Office of the Chief Actuary computes all unisex life table values from the corresponding male and female life table values based on the assumption of an annual sex ratio³ of 1,050 male births for every 1,000 female births. Thus, a unisex life table is created by combining a male life table with radix 105,000 and a female life table with radix 100,000, and then rescaling the combined table to radix 100,000. At a given age x , the unisex life expectancy is calculated as:

$$e_{x,u} = \frac{l_{x,m}e_{x,m} + l_{x,f}e_{x,f}}{l_{x,m} + l_{x,f}} \quad (1)$$

¹ These actuarial functions are described in chapter IV, section A, of Actuarial Study Number 120, [Life Tables for the United States Social Security Area 1900-2100](http://www.ssa.gov/OACT/NOTES/pdf_studies/study120.pdf). This study can be found at: http://www.ssa.gov/OACT/NOTES/pdf_studies/study120.pdf.

² The radix of a life table is defined as l_0 , and is selected to be an arbitrary, but generally large, integer.

³ Since 1940, the sex ratio has varied between 1,045 and 1,059 male births to 1,000 female births. For more information on the sex ratio, see the National Vital Statistics Report (NVSr), Volume 53, Number 20. Data for more recent years are available in more recent NVSRs.

For unisex life expectancy at birth, Equation (1) can be reduced to:

$$e_{0,u} = \frac{1.05e_{0,m} + 1.00e_{0,f}}{2.05} \quad (2)$$

In other words, unisex life expectancy at birth is equal to the sum of 1.05 times male life expectancy at birth, plus female life expectancy at birth, divided by 2.05.

While unisex life expectancy at birth puts more weight on male life expectancy than on female life expectancy, the reverse is true for unisex life expectancy at age 65. This is because male mortality rates are generally higher than female rates. Thus, as age increases, the percentage of the population that is male decreases. By age 65, there are roughly 6 percent more women than men, so the unisex life expectancy formula for age 65 can be reduced to:

$$e_{65,u} = \frac{1.00e_{65,m} + 1.06e_{65,f}}{2.06} \quad (3)$$

The tables on the following pages correspond to tables V.A4 and V.A5 of the 2025 Trustees Report. However, the tables included in this note are for the intermediate alternative only, and include data for each year from 1940 through 2100. Table 1 presents historical and projected unisex life expectancy on a period basis, and table 2 presents the unisex life expectancy on a cohort basis. For comparison purposes, tables 1 and 2 also present sex-specific life expectancy.

Table 1 - Period Life Expectancy¹

| Calendar Year | Unisex | | Male | | Female | |
|-------------------------|----------|-----------|----------|-----------|----------|-----------|
| | At birth | At age 65 | At birth | At age 65 | At birth | At age 65 |
| Historical Data: | | | | | | |
| 1940 | 63.5 | 12.7 | 61.4 | 11.9 | 65.7 | 13.4 |
| 1941 | 64.1 | 13.0 | 61.9 | 12.2 | 66.5 | 13.8 |
| 1942 | 64.9 | 13.3 | 62.6 | 12.4 | 67.4 | 14.1 |
| 1943 | 64.6 | 13.0 | 62.2 | 12.1 | 67.1 | 13.7 |

| 2100 | 85.5 | 23.7 | 83.7 | 22.6 | 87.4 | 24.7 |

¹ The period life expectancy at a given age for a given year is the average remaining number of years expected prior to death for a person at that exact age, born on January 1, using the mortality rates for that year over the course of his or her remaining life.

² Estimated using final data for ages below 65 and preliminary data for ages 65 and older.

³ Estimated using preliminary data.

⁴ Estimated using the intermediate assumptions of the 2025 Trustees Report.

⁵ The projected values are based on the intermediate assumptions of the 2025 Trustees Report.

Actuarial Note No. 2025.2
Social Security Administration
Office of the Chief Actuary
June 2025

| 2099 | 89.2 | 24.3 | 87.7 | 23.3 | 90.7 | 25.4 |
| 2100 | 89.2 | 24.4 | 87.8 | 23.4 | 90.8 | 25.4 |

¹ The cohort life expectancy at a given age for a given year is the average remaining number of years expected prior to death for a person at that exact age, born on January 1, using the mortality rates for the series of years in which the individual will actually reach each succeeding age if he or she survives. All mortality rates are consistent with those used for the intermediate assumptions of the 2025 Trustees Report.

² Cohort life expectancy at birth for those born in the calendar year is based on a combination of actual, estimated, and projected death rates for birth years 1940 through 2022. For birth years after 2022, these values depend on estimated and projected death rates.

³ Age 65 cohort life expectancy for those attaining age 65 in calendar years 1940 through 2021 is based on a combination of actual, estimated, and projected death rates. After 2021, these values depend on estimated and projected death rates.
