National Health Expenditures, Fiscal Year 1975

by MARJORIE SMITH MUELLER and ROBERT M. GIBSON*

According to preliminary estimates of the Nation's health spending in flscal year 1975, health expenditures reached \$1185 billion, or \$547 per person Total health spending showed a 14-percent rise, significantly higher than the increase in 1974 when price controls in the health industry were in effect for most of the year The acceleration of health spending during 1975 was accompanied by a slackening in the growth of the gross national product Expenditures for this purpose, as a share of the GNP, thus rose significantly to 83 percent Public spending grew two and one-half times as fast as private spending in 1975, mainly because of the continuing expansion of Medicare and Medicaid Third parties financed an estimated twothirds of all personal health care spending, with the government share 40 percent and that of private insurance 27 percent

AMERICANS SPENT a total of \$1185 billion for health care in fiscal year 1975 through public and private funds—an average of \$547 a person. The amount spent in 1975, the first full year after the economic stabilization program ended, was up 14 percent from the 1974 total.

The acceleration in health expenditures was accompanied by a slackening in the growth of the gross national product (GNP) in 1975 (chart 1) Accordingly, health care outlays as a proportion of GNP rose significantly to 83 percent, after a 3-year period in which the share of GNP had leveled off at about 78 percent. If the GNP had grown at its 1974 rate, the share for health care outlays would have been about 80 percent.

The data reported for 1973 and 1974 in last year's article in this series have been revised, as more reliable data have become available

EXPENDITURES IN FISCAL YEAR 1975

The Nation's \$1185 billion expenditure for health care is a function of prices of goods and services, per capita utilization, supply of facilities and health manpower, and the quality and

quantity of inputs including the cost of new health care technology (table 1) Price increases continue to be the major contributor to the rise in expenditures Medical care prices as reflected by the consumer price index greatly accelerated in 1975, according to the data shown below, in

	Percentage increase											
Fiscal year	CPI, all items	Medical care, total	Hospital service charges 1	Hospital semi- private room charges	Physicians'	Den- tists' fees						
1965	1 3 2 2 3 0 3 3 4 8 5 9 5 2 3 6 4 0 9 0	21 29 65 65 65 69 471 57	3 2 7 9 15 4	5 3 6 1 17 3 15 9 13 5 12 8 13 3 9 5 6 0 18 4	3 1 3 9 7 4 1 6 1 7 2 7 5 5 2 6 5 0 12 8	2 9 2 9 4 5 5 5 8 6 8 6 0 0 5 7 1 4 4 10 8

Source Bureau of Labor Statistics, Consumer Price Index

marked contrast to the relatively moderate fiscal year increases observed while the economic stabilization program was in effect (August 1971–April 1974)

Types of Expenditures

Hospital care continues to represent the major share (393 percent) of spending for health purposes (table 2) Approximately \$46 6 billion, 16 6 percent more than the amount a year earlier, was spent for care in hospitals. The increase, which accelerated sharply from the 105-percent rise in the previous year, is attributable for the most part to increases in costs; utilization was a less important factor As the tabulation that follows indicates, hospital expenses per adjusted patient day, as reported by the American Hospital Association, jumped 158 percent in 1975—compared with rises of 15 percent in the number of inpatient days and 18 percent in admissions and with no change in the average length of stay (after slight declines in the previous 5 years).

Outlays for physicians' services (\$22 1 billion),

the second largest category of health expenditures, showed a sharp rise from 1974 (129 percent, compared with 88 percent in the preceding year) The rate of increase in expenditures for physicians' services was about the same as the rate of increase before price controls were instituted—133 percent in 1970 and 123 percent in 1971.

Expenditures for nursing-home care reached \$9 billion in 1975, up 20 8 percent from 1974. The rise was nearly one and three-fourths times the rate of increase in 1974. All levels of nursing-home care are included in expenditures for this category. The rapid growth of expenditures over the past 9 years, as well as trends in sources of funding, is shown below. The share from public

¹ Revised Preliminary

funds reached a peak in 1968, shortly after the advent of the Medicare and Medicaid programs After 1968, tightened controls on the utilization of skilled-nursing facilities resulted in a drop in Medicare outlays for this type of care Public spending started to rise again in fiscal year 1972 when Medicaid began paying (beginning January 1, 1972) for services in intermediate-care facilities. The public share has grown steadily, particularly in the past 3 years, mainly due to increased Medicaid spending for this purpose—rising from 47.7 percent in 1973 to 57.8 percent in 1975.

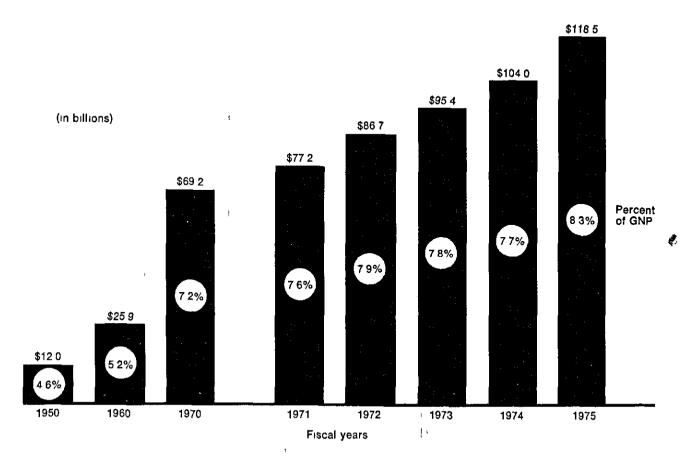

Source of Funds

The accelerated growth rates in public expenditures particularly during the past 2 years—public spending increased almost twice as fast as private spending in 1974 and two and one-half times as fast in 1975—have changed the previously relatively stable relationship of the two sources of funds In fiscal year 1975 public funds were the source of 42 2 percent of all health care spending; they were about three-fourths as large as the amount coming from private funds (in 1973, they were a little less than two-thirds of the private spending)

Public funds for health care came from all levels of government—Federal, State, and local The Federal share of total public spending has always been the larger With the advent of Medicare and Medicaid it has become dominant, jumping from 42 percent in fiscal 1966 to 60 percent in 1967, the first full year of the two programs In 1975, the Federal share was 675 percent

Private health expenditures consist mainly of direct payments by consumers for health care and insurance payments made in their behalf. The remainder comes from philanthropy and industry expenditures for the maintenance of in-plant services, capital expenditures for construction of medical facilities or their renovation or expansion, and some outlays for research by private foundations. Consumer expenditures—direct payments and insurance benefits—totaled \$63.8 billion in 1975—\$5.6 billion or 9.5 percent higher than in 1974. Other private spending, including philanthropy and amounts spent by industry for in-plant health services, totaled \$4.8 billion or about 3 percent lower than in fiscal year 1974.

CHART 1.—National health expenditures and percent of gross national product, selected fiscal years 1950-75

Private dollars for health care were spent in a different way from public funds Almost a third of private payments went for hospital care and about a fourth for physicians' services, dental bills and drugs accounted for another fourth of private expenditures Only 4 percent of private dollars were used for research and construction

More than half of the public spending, on the other hand, went for hospital care and a little more than one-fourth for physicians' services and nursing-home care Government allocated 7 percent of its spending to public health activities and 9 percent for research and medical-facilities construction

Government spending for medical research and construction represented three-fifths of all spending for this purpose There was a 16-percent increase in expenditures for research and a 26-percent increase in construction expenditures Federal funds were concentrated on research (79 percent), State and local expenditures on construction (93 percent) Similar patterns of dis-

tribution for this category had existed in 1974.

There is a caveat to be observed in pursuing the above analysis by source of funds Outlays under government programs reflect enrollee contributions—under the Medicare program, for example This classification conforms with that of social insurance in the Social Security Administration social welfare expenditure series Admittedly, it tends to slightly understate the private share

To illustrate. In 1975, premium payments by enrollees (excluding those paid by Medicaid) accounted for almost 10 percent of Medicare receipts If these premium payments were classified as private expenditures, the private share of national health expenditures would be raised from 578 percent to 593 percent

Total Medicare receipts amounted to \$169 billion in 1975; total expenditures were \$148 billion The percentage distribution of these receipts, by source of funds—payroll tax, premium payments by enrollees, premium payments by Medicare receipts amounted to \$169 billion in 1975; total expenditures were \$148 billion The percentage distribution of these receipts, by source of funds—payroll tax, premium payments by Medicare receipts amounted to \$169 billion in 1975; total expenditures were \$148 billion The percentage distribution of these receipts.

Expenditures Under Public Programs

Government spending—Federal, State, and local—for health services and supplies totaled \$45 6 billion in 1975 Almost \$31 billion came from Federal sources, the remaining \$15 billion from State and local governments

Each government program is listed in table 3 along with amounts spent during fiscal years 1973, 1974, and 1975, by type of health care service and administrative costs Federal and State/local payments are shown separately to distinguish between

programs financed solely by Federal funds, those by State and local funds, and those by both These programs and their outlays are also reported in the annual BULLETIN article on social welfare expenditures.

Expenditures by governments for health services and supplies rose \$8.3 billion in 1975, an increase of 22.4 percent over 1974—almost double the 12.5-percent rise in the previous year. The increase is due to the rapid inflation since the lifting of price controls, plus expansion in public programs, particularly Medicare and Medicaid Medicare program expenditures expanded 30.3 percent in 1975, compared with a rise of only 19.7 percent in fiscal year 1974. The Medicaid program expanded even more rapidly than Medicare did in 1975 (25 percent)—at double the rate of expansion in 1974 (12.6 percent).

The Medicare and Medicaid programs accounted for 72 percent of the overall rise in public spending The Medicare program spent almost \$15 billion—mostly for hospital care and physicians' services The Medicaid program spent nearly \$13 billion, chiefly for hospital and nursing-home care and physicians' services

The accelerated expansion of the Medicare program was due in part to the increase in the number of disabled persons who received Medicare benefits and in the number who were beneficiaries because of chronic kidney disease. As of January, 1975 the number of disabled persons eligible for Medicare hospital insurance had increased to 1.9

Source Unpublished Treasury reports keyed to Final Statement of Receipts and Expenditures of U S Government

million, including 10,000 with renal diseases; 17 million of the disabled were also eligible for supplementary medical insurance Approximately 9 percent of all Medicare hospital reimbursements and about 115 percent of Medicare suppplementary medical insurance payments were in behalf of this group in 1975

Although coverage of the disabled by Medicare became effective in July 1973, the program was not fully implemented during that first year,

mostly because of delays in filing claims and payment lags. As a result, expenditures for this group were abnormally low in fiscal year 1974. Thus, Medicare expenditures for the disabled were 75 percent larger in 1974 than expenditures in 1973, as the data that follow show

Medicare expenditures for hospital care rose

Source of funds	Benefit expenditures for the disabled (in millions)					
	1974	1975				
Total	\$382 4	\$1 742 O				
Hospital insurance Supplementary medical insurance	249 6 132 8	905 1 836 9				

33 percent from 1974 to 1975. This increase reflected an increase in the unit costs of hospital care and increased utilization of hospital services (Medicare hospital admissions went up 5 percent from 1974 to 1975). In addition, the Medicare expenditures for hospital services in 1974 were understated by approximately \$300 million: Obligations paid that year were reduced by the amount of current financing payments recovered by the Social Security Administration 1 If this

¹ For a fuller explanation of current financing payment recoveries, see Marjorie Smith Mueller and Robert M Gibson, "Age Differences in Health Care Spending, Fiscal Year 1974," Social Security Bulletin, June 1975, page 9

amount were to be included with the hospital expenditures for 1974, the increase would be reduced to 25 percent. The rises in expenditures for physicians' services and nursing-home care were in the same magnitude as this adjusted increase—27.8 percent and 26.6 percent, respectively. The sharpest rise in spending was for other professional services—from \$342 million to \$509 million, a 75.1-percent increase reflecting largely the greater utilization of home health services. Expenditures for other professional services, however, represented only about 1 percent of total Medicare program outlays.

Probably the major factor in the steep rise in

Medicare hospital benefits was the switch in fiscal year 1975 by many providers—following repayment of outstanding current financing funds in fiscal year 1974—to the "periodic interim payment" method of financing Payments under this method, which are based on estimated costs and utilization, were 65 percent greater than they were in fiscal year 1974 and accounted for half the increase in hospital benefits. The rise in Medicare medical insurance benefits was largely the result of catch-up increases in physicians' fees after the economic stabilization program ended. Medicare placed a limit of 55 percent on fee increases in determining its calendar-year base for payments

for fiscal year 1974; the amounts paid physicians in fiscal year 1975 were based on prevailing and customary charges, derived from actual charges ın calendar year 1973

Medicaid payments totaled \$130 billion in fiscal year 1975. The 25-percent rise in expenditures was attributable to increases in the number of recipients as well as to rising hospital care costs and physicians' fees Preliminary estimates indicate that the number of Medicaid recipients went up from 219 million in fiscal year 1974 to 243 million in 1975, an increase of 107 percent Dental care expenditures and outlays for other professional services also rose substantially

Medicaid expenditures include amounts paid as premiums into the Medicare supplementary medical insurance trust fund in behalf of aged and disabled persons who either receive public assistance cash payments or are medically indigent These premium payments are used by Medicare to finance services under the supplementary medical insurance program. Since they are reported as expenditures by both the Medicaid and Medicare programs, a small amount of

¹ Preliminary estimates

Includes premium payments for supplementary medical insurance by

Includes premium payments or supplementary includes institution or in behalf of enrollees
Includes duplication in the Medicare and Medicaid amounts where premium payments for Medicare are financed by Medicaid for cash assist ance recipients and, in some States, for the medically indigent
Includes medical benefits paid under public law by private insurance

carriers and self insurers

Payments for services outside the hospital (excluding "other health services") represent only those made under contract medical care programs

Beginning in 1974, data not separable from total education expenditures

Beginning in 1974, included with "other public health activities"

Revised estimates

duplication results and public expenditures are thus slightly overstated. The amounts of premiums that have been paid by States for this "buy-in" coverage are as follows.

	Amount
Fiscal year	(in millions)
1967	\$32 1
1968	53 0
1969	75.8
1970	97 2
1971	131 5
1972	137 9
1973	
1974	
1975	213 1

The next largest category of public health spending—general hospital and medical care—also accelerated in 1975, reacting to inflationary pressures. The rise was 8.5 percent, compared with a rise of 7.4 percent in 1974. Direct medical services are provided by the Federal Government primarily through Public Health Service hospitals and Indian health services. State and local spending—80 percent of the total in this category—represents primarily funds expended for the operation of State or local psychiatric hospitals.

Expenditures for State and local school health and the Federal Office of Economic Opportunity (OEO) programs are shown only for fiscal year 1973 Estimates of school health outlays in 1974 and 1975 were not available separately from the education category. The health activities of OEO were transferred in fiscal year 1974 to the Department of Health, Education, and Welfare and are currently included in "government public health activities"

Fifty-six percent of all public spending for health care was for hospital care, with the share of the total for this purpose declining from 57 percent in 1974 and 58 percent in 1973 Almost one-fourth of public funds went for physicians' services and nursing-home care In 1974, spending for these categories amounted to 23 percent of the total; in 1973 it was 22 percent.

For the various types of health care, the share of total expenditures differs with the program and, of course, reflects the program focus Ninety-eight percent of the outlays from the general hospital and medical care program were for hospital care, for example, and 93 percent of Medicare expenditures went for hospital care and

physicians' services The medical vocational rehabilitation program, on the other hand, spent half its funds on physicians' services Seventy percent of Veterans Administration expenditures went for hospital costs Department of Defense health expenditures were also mainly for hospital care (63 percent). Expenditures by State temporary disability programs and State and Federal workmen's compensation programs reflected their emphasis on both hospital and medical care 95 percent of the expenditures under temporary disability insurance were for these services, workmen's compensation programs allocated 50 percent for hospital care and 43 percent for physicians' services

Federal outlays for administration of Medicare decreased 1 percent—from \$667.2 million in 1974 to \$660.6 million in 1975. Administrative costs amounted to 4.5 percent of total Medicare expenditures

Medicaid administrative costs were 3.3 percent of the total program expenditures (\$13 billion) by the States and the Federal Government The Federal administrative cost ratio was 3.9 percent; the State and local government ratio was 3.4 percent.

Medical Education

As a category, "medical training and education" is not included in the estimates of total health expenditures Some components of this category, however, are included—mainly training outlays that cannot be separated from hospital expenses and medical research Most of these expenditures are made by the Department of Defense and the Veterans Administration Shown below are data on Federal spending for medical

education and training compiled by the Office of Management and Budget These Federal expenditures include, principally, direct support for health professional schools and for student assistance through loans and scholarships Training is funded for a wide variety of health professionals, including physicians, dentists, nurses, mental health and other health professionals, research personnel, and paramedical personnel

A study by the Institute of Medicine of the National Academy of Sciences presents estimates of the total cost of education for eight health professions ² The study reports that \$3 1 billion was spent for the education of more than 300,000 students in 1972 About 25 percent (\$765 million) of this expenditure was financed by unrestricted

population (including ${\bf A}{\bf r}{\bf m}{\bf e}{\bf d}$ Forces and Federal civilian employees overseas and the civilian population of outlying areas)

Federal and State government funds The remainder was financed through private sources or through other types of Federal and State support

TRENDS IN HEALTH EXPENDITURES

Health expenditures for Americans have increased on an average of 12 percent per year since 1965 (table 4) During this 10-year period health spending has more than tripled—from \$38 9 billion in 1965 to \$118 5 billion in 1975—and its share of the GNP has risen from 5 9 percent to 8 3 percent Apart from inflationary prices within the health care industry, other factors—mainly greater utilization and improvements in quality of care—have interacted to bring this about.

Technological developments in areas such as equipment and drugs, as well as improved treat-

² Preliminary estimates
³ Based on January 1 data from the Bureau of the Census for total U S

^{*}National Academy of Sciences, Institute of Medicine, Costs of Education in the Health Professions Report of a Study, Parts 1 and II, 1974 The eight professions studied are medicine, osteopathy, dentistry, optometry, pharmacy, podiatry, veterinary medicine, and nursing

ment procedures and new techniques—all have added substantially to the health care bill in recent years 8

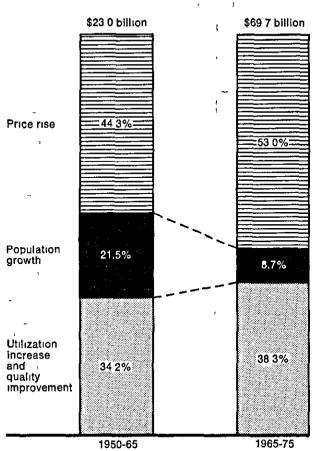

In addition to the effect of price increases and technological change, aggregate spending levels are influenced by population growth and by changes in per capita utilization resulting from changes in both demand and supply factors Although per capita expenditures eliminate the effect of population growth, health expenditures still registered substantial increases from 1965 to 1975 During this period, per capita expenditures rose from \$198 to \$547, an average annual increase of 107 percent Since this increase is only slightly less than the 118-percent average annual rate for aggregate expenditures, it appears that population growth has had relatively little effect on aggregate expenditures In general, with the decline in the population growth rate in the late 1960's and the 1970's, the effect of rising population on the increases in health expenditures has continued to dwindle

What has been the proportionate effect of these factors on the increasing expenditures for health care? As seen in chart 2 and in the following tabulation, population growth has had a rapidly

Source of increase	1950-75	1950-65	1965-75			
	Amount of increase (in billions)					
Total	\$92 7	\$23 0	\$69.7

diminishing effect in the past 10 years. Only an estimated 9 percent or \$6.1 billion of the \$69.7 billion increase from 1965 to 1975 can be attributed to population growth. Price rises alone account for an estimated 53 percent or \$36.9 billion of the rise during that period. The remaining 38 percent (\$26.7 billion) can be attributed to greater utilization and improvements in the qual-

CHART 2 —Factors affecting increases in personal health care expenditures, fiscal years 1950-65 and 1965-75

ity of care In contrast, during the period 1950-65, population change accounted for 22 percent of the increase, price rises were the source of 44 percent of increased expenditures, and the remaining 34 percent was attributable to increased utilization and quality-of-care improvements

THIRD-PARTY PAYMENTS

Private health insurance paid \$27.3 billion in benefits to consumers in 1975 (15.3 percent more than in the previous year). The amounts paid in claims by insurance companies, Blue Cross-Blue Shield plans, and independent plans (community, employer-employee-union, individual and group practice, and other) are almost triple the private health insurance benefits of 10 years ago. The depth of coverage, however, remains a problem Table 5 and chart 3 show that, although private insurance payments covered 35.8 percent of hos-

Preliminary estimates Includes other professional services, eyeglasses and appliances, nursing home care, and other services not elsewhere classified

pital costs and 390 percent of physicians' fees, the consumer had only minimal help from insurance for his dentist bills, prescription drugs and drug sundries, and all other health services. Thus, 61 cents of every insurance claim dollar goes for hospital bills, 31 cents for physicians' services, 3 cents for the dentist, 3 cents for drugs and drug sundries, and the remaining 2 cents for private-duty nursing, vision care, nursing-home care, visiting-nurse service, and other types of care

Third-party payments are those made by private health insurance, government, philanthropy, and industry The contribution of third parties to personal health care financing—expenditures for health services and supplies—though climbing rapidly in recent years, particularly in government spending, still leaves the consumer with direct out-of-pocket expense for a third of his health care bills Although third parties accounted for 92 cents of every hospital care dollar spent, the consumer paid directly more than a third of his charges for physicians' services, 85

percent of his dentist bills, 85 percent of the cost of drugs, and 42 percent of the charges for all other health care services

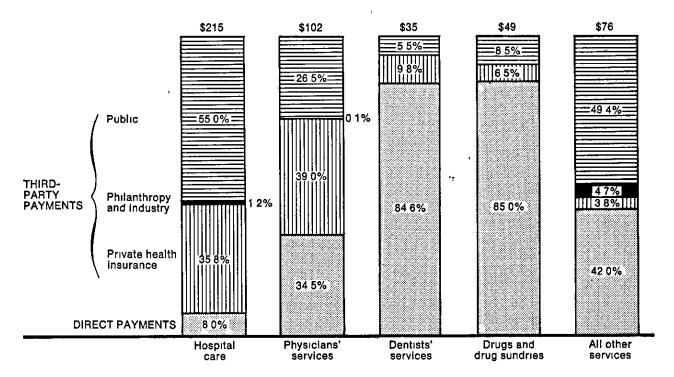

The upward trend in third-party payments that began with the advent of the Medicare and Medicaid programs in 1967 has continued steadily with the expansion of those programs and with the slow but steady growth of private insurance benefits (table 6) In 1967, third-party payments represented more than half of all personal health care expenditures for the first time. By 1970, government and private health insurance, with a small contribution from philanthropy and private industry, paid three-fifths of these costs; by 1975, they paid two-thirds As a result, the consumer's direct share of costs has inched downward from 45 percent in 1967 to 33 percent in 1975 The consumer's expenditures in dollars-because of inflationary pressures, improvements in technology, and other factorshave more than tripled, however, since 1950 and were a third higher in 1975 than in 1970

The relative shares paid by the various third parties have been fairly stable since the early years of Medicare and Medicaid In 1950, before private health insurance had seen any real growth, consumers were paying almost 70 percent of their health bills directly, with third parties picking up less than a third of the costs Insurance met only 8 percent of costs, philanthropy and industry covered only 3 percent, and government funds met the remaining 20 percent.

As a result of the rapid growth of the health insurance industry, by 1965 insurance payments met 25 percent of health care costs, public spending remained at about 21 percent, and consumer bills were down to 52 percent of total costs Following enactment of Medicare and Medicaid, public spending surged upward and the share paid by private insurance dropped slightly. In 1975 government paid for almost 40 percent of all personal health care expenditures, but private insurance had leveled off at less than 27 percent, leaving consumer direct payments at about a third of total outlays.

Third-party payments have mainly affected hospital care expenditures (table 7) In 1950, consumers' payments accounted for a little more than a third of all hospital expenditures. The growth in private insurance coverage of hospital care was rapid in the 1950's and early

CHART 8.—Percentage distribution of per capita personal health care expenditures, by type of expenditure and source of funds, fiscal year 1975

1960's, and by 1965 private insurance paid 42 percent of hospital costs and consumer payments dropped to 18 percent After Medicare and Medicaid came into full swing, the share of private insurance dropped to about 35 percent, and government spending for hospital care rose to more than 50 percent In 1975, public funds accounted for 55 percent of hospital care expenditures and insurance benefits paid for 36 percent, leaving the consumer to finance directly only 8 percent of hospital care outlays

The impact of third parties on expenditures for physicians' services has been less dramatic, though substantial Before its swift growth, private insurance paid only about 10 percent of doctor bills. The consumer paid directly 85 percent of all expenditures for physicians' services, and government picked up the remaining 5 percent By 1965, insurance payments took care of 30 percent of physicians' bills and the consumer's share was reduced to 63 percent. Once Medicare and Medicaid became firmly established, however, the government share had risen to about 22 percent and insurance payments were slowly rising, with consumer direct payments down to less than 50 percent. In 1975, direct payments repre-

sented about one-third of the total and covered a little less than two-thirds of expenditures for physicians' services insurance met 39 percent, government 26 percent.

Despite these increases in third-party financing of hospital and physicians' services, the consumer still pays directly a large share of the outlays for all other health services—dentists and other professional services, drugs and drug sundries, eyeglasses and appliances, nursing-home care, and other health services As of 1975, little private insurance had been written to cover such services; consequently, private insurance paid only 6 percent of these costs. Government spending (mostly for Medicaid) accounted for 27 percent, leaving the consumer to make direct payments for almost two-thirds of these bills

DEFINITIONS, METHODOLOGY, AND SOURCES OF DATA

Estimates of national health expenditures are compiled by type of expenditure and source of funds For 1974 and 1975, the data for the public sector represent the outlays of 10 categories of

BULLETIN, FEBRUARY 1976

government health programs ⁴ In previous years, 12 such categories were shown, but for two of these categories—school health and OEO programs—data are no longer shown separately For several Federal health programs, the data are taken from the Office of Management and Budget special analysis of health programs ⁵ For the remainder, the data are supplied by the various agencies

In the private sector, the data are estimated first on a calendar-year basis by type of expenditure and are then converted to fiscal-year figures on the basis of price and utilization change during 6-month periods The general method is to estimate the total outlays for each type of medical service or expenditure and then to deduct the amounts paid to public and private hospitals, physicians in private practice, etc., under the public programs reported in the social welfare expenditure series The fiscal-year figures for each public program are allocated by type of expenditure on the basis of published and unpublished reports for each program In general, the consumer expenditures are residual amounts, derived by deducting philanthropic and government expenditures from the total spent for each type of service

Hospital Care

The estimates of expenditures for hospital care are derived chiefly from American Hospital Association data on hospital finances, increased slightly to allow for osteopathic hospitals Expenditures for the education and training of physicians and other health personnel are included only where they are not separable from the costs of hospital operations

Expenditures by the Veterans Administration and the Department of Defense for physicians' services (except under contract medical care programs) are included as part of hospital care expenditures Services of salaried physicians in

psychiatric, tuberculosis, and general hospitals—whether public or private—are part of hospital care, but self-employed physicians' services in hospitals are not counted as hospital expenditures. The costs of drugs used in hospitals are also included with hospital care. Anesthesia and X-ray services are sometimes classified as hospital care expenditures and sometimes as expenditures for physicians' services, depending on billing practices

Federal expenditures for hospital care represent total expenses for care in Federal hospitals (less any patient payments) plus vendor payments under government programs to non-Federal hospitals Similarly, State and local expenditures include net expenses for care in State and locally owned hospitals as well as vendor payments to nongovernment hospitals Consumer payments for hospital care represent total hospital revenues less all government payments and estimated receipts from philanthropy.

Services of Physicians and Other Health Professionals

Estimated expenditures for the services of physicians and dentists in private practice are based on the gross income from self-employment practice reported by physicians and dentists to the Internal Revenue Service (and shown in its report, Statistics of Income—Business Income Tax Returns) Gross receipts are totaled for practitioners in sole proprietorships and partnerships The total also includes the estimated gross income of corporate offices, that portion of gross receipts of medical laboratories estimated to represent patient payments, and the estimated expenses of group-practice prepayment plans in providing physicians' services (to the extent that these are not included in physicians' income from self-employment), as well as those of grouppractice dental clinics Estimated receipts of physicians for life insurance examinations are deducted

The gross receipts of physicians and dentists represent total expenditures for these services. Consumer payments are estimated by deducting vendor payments under government programs and estimated payments to physicians and dentists from philanthropic agencies

⁴For a description of the public programs, see Barbara S Cooper and Nancy L Worthington, Personal Health Care Expenditures, by State, Vol 1 Public Funds, 1966 and 1969, Office of Research and Statistics, 1973

Revised estimates

ment of Commerce counts this expenditure as a consumer expenditure, but the Office of Research and Statistics considers it an expenditure of government Total expenditures for drugs and appliances represent the sum of these consumer expenditure estimates and the expenditures under all public programs for these products.

Nursing-Home Care

Expenditures for nursing-home care encompass spending by both private and public sources in all facilities providing some level of nursing care Included are all nursing homes certified by Medicare and/or Medicaid as skilled-nursing facilities and those certified by Medicaid as intermediatecare facilities and all other homes providing some level of nursing care even though they are not certified under either program

Expenditure estimates are based on periodic surveys of nursing homes conducted by the National Center for Health Statistics of the Department of Health, Education, and Welfare The estimates for total expenditures are derived from survey data on utilization and charges for a total universe of nursing-care homes and personal-care homes with nursing, as defined by the Center. Estimates for intervening years (for which no data are available) are based on available economic and other indicators

Consumer expenditures in nursing homes represent the difference between total nursing-home expenditures and expenditures from philanthropic and government sources for services in skilled-nursing facilities and intermediate-care facilities

Expenses for Prepayment and Administration

Prepayment expenses represent the difference between the earned premiums or subscription income of health insurance organizations and their claims or benefit expenditures (or expenditures for providing such services in the case of organizations that directly provide services) In other words, it is the amount retained by health insurance organizations for operating expenses, additions to reserves, and profits It is considered a consumer expenditure

Preliminary estimates

Preliminary estimates

Includes dentists' services, other professional services, drugs and drug sundries, eyeglasses and appliances, nursing home care, and other health

services
4 Included in "physicians' services", data not available separately

For a complete definition, see Monthly Vital Statistics Report, vol 23, No 6, Supplement, National Center for Health Statistics, 1974, pages 11-12

Data on the financial experience of health insurance organizations are reported annually by the Office of Research and Statistics in an article on private health insurance. Data for 1974 will appear in the March 1976 BULLETIN.

The administration component includes the estimated amounts expended by philanthropic organizations for fund-raising activities. In addition, it includes administrative expenses (where they are reported) of federally financed health programs Such data were available for Medicare and Medicaid and for the Veterans Administration and Department of Defense contract medical care programs.

Government Public Health Activities

The category "government public health activities" is the same as the "other public health activities" category in the social welfare series of the Office of Research and Statistics The Federal portion consists of outlays for the organization and delivery of health services, the prevention and control of health problems, and similar health activities administered by various Federal agencies, chiefly the Department of Health, Education, and Welfare The data for these programs are taken from the Special Analyses of the Budget

The State and local portion represents expenditures of all State and local health departments and intergovernment payments to the States and localities for public health activities. It excludes expenditures of other State and local government departments for air-pollution and water-pollution control, sanitation, water supplies, and sewage treatment. The source of these data is Government Finances (annual publication of the Bureau of the Census).

Other Health Services

Items of expenditure that could not be classified elsewhere are brought together in the category "other health services" It includes, for each public program, the residual amount of expenditures not classified as a specific type of medical service In addition, it includes the following. (1) Industrial in-plant services, (2) school health services, before 1974, and (3) medical activities in Federal

units other than hospitals

Industrial in-plant services consist of amounts spent for maintaining in-plant health services and are based on estimates made by the National Institute for Occupational Safety and Health of the Public Health Service

Until 1974, expenditures for school health were estimated by the Office of Education and reported as a separate item in the social welfare expenditure series. As of 1974, separate estimates for this item were no longer available and, although expenditures for this purpose continue to be included in the social welfare expenditure series as part of total expenditures for education, school health is no longer included as a health expenditure

Medical activities in Federal units other than hospitals are residual amounts that represent primarily the cost of maintaining outpatient facilities (separately from hospitals) and field and shipboard medical stations

Expenditures for private voluntary health agencies, included in the "other" private outlays, are the expenditures that remain after amounts for hospital care, physicians' services, etc, have been distributed They represent the amounts spent for health education, lobbying, fundraising, etc

Medical Research

Expenditures for medical research include all such spending by agencies whose primary object is the advancement of human health. Also included are those research expenditures directly related to health that are made by other agencies, such as those of the Department of Defense or the National Aeronautics and Space Administration Research expenditures of drug and medical supply companies are excluded, since they are included in the cost of the product The Feder-1 amounts represent those reported as medical research in the Special Analyses of the Budget. The amounts shown for State and local governments and private expenditures are based on published estimates that have been prepared by the National Institutes of Health—primarily in the annual publication, Basic Data Relating to the National Institutes of Health.

NATIONAL HEALTH EXPENDITURES

(Continued from page 20)

Construction of Medical Facilities

Expenditures for construction represent "value put in place" for the hospitals, nursing homes, medical clinics, and medical research facilities but not for private office buildings providing office space for private practitioners Excluded are amounts spent for construction of water-treatment or sewage-treatment plants and Federal grants for these purposes

The data for "value put in place" for construction of publicly and privately owned medical facilities in each year are taken from the Department of Commerce report, Construction Review Amounts spent by Federal and State and local governments for construction are subtracted from the total The residual represents the amount coming from private funds

Includes dependents
 Beginning Oct 1966, includes special benefits authorized by 1966 legislation for persons aged 72 and over and not insured under the regular or transitional provisions of the Social Security Act
 Monthly number at end of quarter
 Average number during 14-day registration period
 Average weekly number Includes regular State unemployment insur-
